Executive Summary

Study Overview

Lakeshore Development Inc. ("the Developer") has proposed the new Park Lawn GO Station to be developed in partnership with Metrolinx, located at the north end of 2150 Lake Shore Boulevard West in the City of Toronto ("the Project"). Hatch was retained by the Developer to undertake an Environmental Assessment (EA) for the proposed Park Lawn GO Station on the Lakeshore West rail corridor. The evaluation of environmental impacts of the proposed Park Lawn GO Station has been carried out in accordance with the Transit Project Assessment Process (TPAP). The TPAP is regulated by the *Environmental Assessment Act* (EAA) under Ontario Regulation 231/08 – Transit Projects and Metrolinx Undertakings (O. Reg. 231/08). The purpose of the TPAP is to ensure effects associated with the Project are clearly identified and mitigated to the greatest extent feasible. For TPAP purposes, Metrolinx is the proponent. The Developer will be constructing the Project and will be responsible for incorporating mitigation measures to address both construction and operation-related effects. Metrolinx will be responsible for operations and maintenance at the GO Station.

The Initial Business Case (IBC) (2016) recognized Park Lawn as a strategic location of dense development and growth, as well as opportunity to integrate with local transit in the area. The commitment of GO Regional Express Rail (now referred to as GO Expansion) including more frequent and faster service creates significant opportunity to realize a transit hub bringing together and integrating higher order transit, local transit and other modes. An updated IBC (2018) considered an updated service plan, realigned station to minimize impacts on existing infrastructure, and a redefined station design. An updated IBC (2020) was published June 11, 2020.

This Project will be coordinated with the City of Toronto as appropriate to provide improved local transit access and connectivity to the GO Station, as well as additional and more frequent transit service.

The Park Lawn GO Station will provide a stop between Mimico GO Station and Exhibition GO Station. The Park Lawn GO Station will be located 100 metres south of the Gardiner Expressway, 300 metres northwest of Lake Shore Boulevard West, on both sides of Park Lawn Road, and both sides of the Lakeshore West rail corridor within the City of Toronto.

The Park Lawn GO Station will include a fully accessible station building with platform access points, tunnel infrastructure, multimodal access, bicycle parking and connections with local transit.

This Transportation Brief ("Brief") has been prepared to document the Existing Conditions, and assess the potential effects of the new GO Station on the area transportation networks.

A key consideration in the preparation of this Brief is that the GO Station will be a low generator of traffic trips, noting that there is no commuter parking proposed. The scope for this Brief recognizes the above and that significant other studies are addressing development infrastructure needs. As such, the scope is focussed on outlining the impacts of the Station itself in the Near Term condition (2028) and providing a qualitative review of the Longer Term condition (2041). This timeframe aligns with the horizon year for the modelling being undertaken as part of the Park Lawn Lake Shore Transportation Master Plan (TMP).

The Study Area for the Brief generally extends, from The Queensway in the north / west, Lake Shore Boulevard West to the south / east, Park Lawn Road to the south / west and the Humber River to the north / east.

Station Overview

The Park Lawn GO Station is planned as an urban station serving the large surrounding existing and planned populations, and is premised largely on walk-in and transit trips to and from the Station. The Station will be integrated with Phase 1 of the 2150 Lake Shore Boulevard West development (2150 Lake Shore), with both being built together and facilities linked and connected.

No commuter parking is proposed. Pick up / drop off (PUDO) is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore Boulevard West development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

Background

In addition to the TPAP, there are currently a number of active planning processes for the area building towards the emergence of a transit orientated neighbourhood.

The transportation and traffic operations in the Humber Bay Shores and South Etobicoke Area is primarily guided by the City, including the ongoing Christie's Secondary Planning (Secondary Plan) process and Park Lawn Lake Shore TMP.

Significant study has also been advanced as part of the Official Plan and Zoning By-Law Amendment applications in support of a significant mixed-use, transit-orientated redevelopment of the 2150 Lake Shore property located immediately adjacent to the Park Lawn GO Station.

The Secondary Plan and Park Lawn Lake Shore TMP are ongoing studies which are anticipated to be completed over the course of 2021/2022. These studies will assess in detail the future mobility needs of the area and assume the development of the GO Station in conjunction with the 2150 Lake Shore site. Detailed modelling of traffic and other mobility networks is being undertaken by the City as part of the Park Lawn Lake Shore TMP for a 2041 condition and information will be provided as part of the final reporting for this process currently scheduled for 2021/2022.

Potential Infrastructure Improvements

As part of the processes outlined above, a variety of new infrastructure is being contemplated to support the proposed area development. The principal elements are outlined below:

Roads

- Construction of Public Street A, which is a new east-west road link proposed to extend from the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection to the Lake Shore Boulevard West / The Marginal Boulevard intersection, primarily through the 2150 Lake Shore site;

- Construction of Public Street B (Loop Road) within the 2150 Lake Shore site;
- Potential construction of a Legion Road extension from its current southern limit near the Gardiner Expressway eastbound off ramp to Park Lawn Road, to its current northern limit near Lake Shore Boulevard West;
- Potential construction of a new north-south street extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street; and
- Potential adjustments to lane configurations resulting in two traffic lanes along Park Lawn Road.

Transit

- Construction of the Park Lawn GO Station;
- Construction of a mobility hub within the 2150 Lake Shore site, which is proposed to accommodate Toronto Transit Commission (TTC) services;
- Diversion of streetcar routes 501 and 508 into the mobility hub via the abovementioned Public Street B (Loop Road); and
- Separation of streetcar and traffic lanes along Lake Shore Boulevard West.

Active Transportation

- Construction of cycle tracks along Lake Shore Boulevard West, Park Lawn Road, The Queensway, the abovementioned new north-south street and Legion Road extensions, and within the 2150 Lake Shore site;
- Urbanization of surrounding streets, improving the pedestrian realm;
- Additional pedestrian crossings at proposed signalized intersections along Lake Shore Boulevard West and Park Lawn Road; and
- Construction of high quality pedestrian facilities through the 2150 Lake Shore site.

Existing Transportation Conditions

Traffic operations analysis results for Existing Conditions indicate that the area road network is currently operating within theoretical capacity, albeit a number of intersections/movements are in high demand.

The Site area currently has reasonable access to TTC streetcar and bus services, but limited access to higher order rail service. Utilization of the TTC transit services vary, with the streetcar services in the highest demand.

Pedestrian infrastructure in the area includes sidewalks along both sides of key roads in the area, with signalized intersections providing crossing opportunities. However, mid-block connections are limited, whilst the 2150 Lake Shore site is currently a large impermeable block which prevents through connections.

Bicycle infrastructure in the area includes a number of off-road trails such as the Humber Bay Park East Trail, however on-road facilities are limited.

Near Term Horizon (2028)

Transportation Conditions

Under the Near Term Horizon (2028), the Station is projected to generate peak hour two-way ridership in the order of 1,050. For travel to/from the Station, the projected ridership is projected to result in the order of 315 local transit trips, 630 walking trips, 50 bicycle trips and 55 PUDO trips (110 two-way vehicle trips).

Key transportation network improvements which are being contemplated by other area studies and are assumed to be in place for the Near Term Horizon (2028), include:

- Construction of Public Street A between Park Lawn Road and Lake Shore Boulevard West;
- Partial construction of the 2150 Lake Shore development internal road network;
- Construction of the Legion Road extension;
- Intersection improvements proposed as part of other area studies, necessary to support the projected future background traffic;
- Construction of bus stops adjacent to the Station, with additional bus services (bus route 80) to be rerouted to the Site area; and
- Construction of new and upgraded active transportation infrastructure along Park Lawn Road, Public Street A and through the partially constructed 2150 Lake Shore development internal road network, providing multiple access routes to/from the Station.

With the road network improvements which are assumed to be in place for the Near Term Horizon (2028), it is projected that future traffic can generally be adequately accommodated, albeit some capacity constraints are identified within the area. As the area continues to evolve, mode shifts, volumes and operations can be expected to continue to adjust, as is being addressed by the Park Lawn Lake Shore TMP. Notably, the number of vehicle trips projected to be generated by the Station itself (110 two-way trips) is relatively low and subsequently, the impact of the proposed Station on the surrounding road network is expected to be minimal. No additional mitigating works are recommended.

Furthermore, the transit and active transportation improvements being contemplated by other area studies as discussed above which are assumed to be in place for the Near Term Horizon (2028) are expected to provide adequate transit, pedestrian and bicycle access to the Station.

Transportation Facilities

Accessible PUDO (paratransit/TTC WheelTrans facilities) is currently contemplated along Public Street A and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program. Pedestrian entrances to the Station will include an entrance from Station Square at the upper level of the Station building, entrances to the lower level of the Station on the north side of the rail corridor (accessible from Public Street A), and an entrance on the east side of Park Lawn Road, just south of the rail corridor. Secondary accesses to the rail platforms will be provided on the north and south side of the rail corridor, on the west side of Park Lawn Road.

At this time, a minimum of 192 covered bicycle parking spaces (generally located at-grade) are to be provided within the Station precinct. An additional minimum of 96 secured bicycle parking spaces are to be integrated into the 2150 Lake Shore development.

Longer Term Horizon (2041)

Transportation Conditions

Under the Longer Term Horizon (2041), the Station is projected to generate peak hour two-way ridership in the order of 1,600. For travel to/from the Station, the projected ridership is projected to result in the order of 480 local transit trips, 960 walking trips, 80 bicycle trips and 80 PUDO trips (160 two-way vehicle trips).

Key additional transportation network improvements which are being contemplated by other area studies and are assumed to be in place for the Longer Term Horizon (2041), include:

- Completion of the 2150 Lake Shore development internal road network;
- Construction of a new north-south road extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street.
- Additional intersection and road improvements proposed as part of other area studies;
- Construction of streetcar stops adjacent to the Station and streetcar tracks alongside Public Street B (Loop Road) within the 2150 Lake Shore development; and
- Additional new and upgraded active transportation infrastructure along Park Lawn Road and Lake Shore Boulevard West, the new north-south street, The Queensway and through the completed 2150 Lake Shore development internal road network.

As previously discussed however, a detailed review of the Longer Term Horizon (2041) is being undertaken through other ongoing area studies, in particular the Park Lawn Lake Shore TMP and the Christie's Planning Study. These studies will ultimately review and estimate the future transportation demands of the area, including the proposed Station and the estimated population and employment numbers in the area, and subsequently determine the infrastructure to be delivered to support these transportation demands.

In a general sense, it is worth noting that as previously discussed, the Station is expected to operate as an urban station, primarily relying on walk, cycle and transit trips to and from the Station from the substantial population and employment in the area. Vehicle trips associated with the Station are projected to be minimal, in the order of 80 PUDO trips (160 two-way vehicle trips), and is not expected to have a significant impact on the operation of the surrounding road network.

Furthermore, the Station itself will significantly influence travel patterns in the area and has the potential to result in a notable shift in transportation mode splits in the area to reduce auto reliance and increase transit mode utilization. As such, on a broader scale, the Station itself is actually expected to reduce vehicle trips generally in the area.

Additionally, building upon the infrastructure assumed to be in place for the Near Term Horizon (2028), further transit and active transportation improvements being contemplated by other area studies as

discussed above are expected to be implemented by the Longer Term Horizon (2041). This infrastructure is expected to provide adequate transit, pedestrian and bicycle access to the Station in the Longer Term Horizon (2041).

Longer Term Horizon (2041)

Transportation Facilities

As further discussed in this report, it is anticipated that a large percentage of station passengers will arrive by non-auto means as a large percentage of the station watershed will be able to walk, cycle or arrive by transit. A well connected pedestrian and cycling network would be constructed, and provide passengers with safe, direct means of travel to / from the station.

PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program. Pedestrian entrances and bicycle parking facilities in the Longer Term Horizon (2041) will remain consistent with the Near Term Horizon (2028).

Construction Conditions

Construction of the proposed Park Lawn GO Station will feature various independent elements, including the north station building, the south station building, a tunnel connecting the two station buildings, the Park Lawn rail bridge widening, and the secondary entrances on the west side of Park Lawn Road.

Throughout all stages of construction, the project team will be committed to reducing impacts on the pedestrian, cyclist, vehicular, and rail traffic. This includes but is not limited to implementing traffic control plans, utilizing traffic control devices, undertaking public information campaigns, developing worker safety plans, and continuous monitoring and review of these elements.

1. Introduction

1.1 Project Description

Lakeshore Development Inc. ("the Developer") has proposed the new Park Lawn GO Station to be developed in partnership with Metrolinx, located at the north end of 2150 Lake Shore Boulevard West in the City of Toronto ("the Project"). Hatch was retained by the Developer to undertake an Environmental Assessment (EA) for the proposed Park Lawn GO Station on the Lakeshore West rail corridor. The evaluation of environmental impacts of the proposed Park Lawn GO Station has been carried out in accordance with the Transit Project Assessment Process (TPAP). The TPAP is regulated by the *Environmental Assessment Act* (EAA) under Ontario Regulation 231/08 – Transit Projects and Metrolinx Undertakings (O. Reg. 231/08). The purpose of the TPAP is to ensure effects associated with the Project are clearly identified and mitigated to the greatest extent feasible. For TPAP purposes, Metrolinx is the proponent. The Developer will be constructing the Project and will be responsible for incorporating mitigation measures to address both construction and operation-related effects. Metrolinx will be responsible for operations and maintenance at the GO Station.

The Initial Business Case (IBC) (2016) recognized Park Lawn as a strategic location of dense development and growth, as well as opportunity to integrate with local transit in the area. The commitment of GO Regional Express Rail (now referred to as GO Expansion) including more frequent and faster service creates significant opportunity to realize a transit hub bringing together and integrating higher order transit, local transit and other modes. An updated IBC (2018) considered an updated service plan, realigned station to minimize impacts on existing infrastructure, and a redefined station design. An updated IBC (2020) was published June 11, 2020.

This Project will be coordinated with the City of Toronto as appropriate to provide improved local transit access and connectivity to the GO Station, as well as additional and more frequent transit service.

The Park Lawn GO Station will provide a stop between Mimico GO Station and Exhibition GO Station. The Park Lawn GO Station will be located 100 metres south of the Gardiner Expressway, 300 metres northwest of Lake Shore Boulevard West, on both sides of Park Lawn Road, and both sides of the Lakeshore West rail corridor within the City of Toronto.

The Park Lawn GO Station will include a fully accessible station building with platform access points, tunnel infrastructure, multimodal access, bicycle parking and connections with local transit. The proposed Project will include:

- Two side platforms (north and south);
- Pick-up and drop off (PUDO);
- Secure bike parking and covered bicycle parking;
- Two-storey main station building (south of tracks);

- Two-storey secondary station building (north of tracks);
- Landscaping and paving around the north Station building;
- Pedestrian tunnel (under tracks) between the two Station buildings;
- Widening of the existing Park Lawn rail bridge;
- Maintenance and Metrolinx staff parking spaces;
- A pavilion with elevator and stairs north of the rail corridor and a sloped walkway south of the rail corridor, both west of Park Lawn Road;
- Protection for the future island platform;
- Electrification enabling work; and
- Signal work.

As a component of the EA, this Transportation Brief ("Brief") has been prepared to document the Existing Conditions, and assess the potential effects of the new GO Station on the area transportation networks.

1.2 Study Area

The Park Lawn GO Station will be located on both sides of the Lakeshore West rail corridor, and will provide a stop between the Mimico GO Station and the Exhibition GO Station.

The Park Lawn GO Station will be located at the north end of the former Mr. Christie Cookie factory. The GO Station will be located 100 metres south of the Gardiner Expressway, and 300 metres northwest of Lake Shore Boulevard West, within the City of Toronto. The approximate proposed Project Footprint (Site) is shown in Figure 1-1.

The Study Area for the Brief generally extends, from The Queensway in the north / west, Lake Shore Boulevard West to the south / east, Park Lawn Road to the south / west and the Humber River to the north / east as illustrated in Figure 1-1.

The Study Area for the Brief has been identified based upon a consideration of an area which will be influenced by travel to and from the proposed Park Lawn GO Station, with the intersections which form the key outlets for access into and out of the area (i.e. The Queensway / Park Lawn Road, Lake Shore Boulevard West / Park Lawn Road and Lake Shore Boulevard West / Palace Pier Court) seen as logical boundary points. Given the limited vehicle trip generation projected to be associated with the Station and that other studies, including the Park Lawn Lake Shore Transportation Master Plan (TMP), will be providing a detailed assessment of a broader area, this was considered appropriate.

1.3 Transportation Brief Objective

As a component of the EA, this Brief will be completed to document the Existing Conditions, and assess the potential effects of the new GO Station on the area transportation networks.

A key consideration in the preparation of this Brief is that the GO Station, while significantly beneficial to the overall mobility of the existing area development and planned new development, will be a low generator of traffic trips, noting that there is no commuter parking proposed.

The scope for this Brief recognizes the above and that significant other studies are addressing development infrastructure needs. As such, the scope is focussed on outlining the impacts of the Station itself in the Near Term condition (2028) and providing a qualitative review of the Longer Term condition (2041).

Overall, this document will provide a high level overview of the transportation implications of the Park Lawn GO Station, recognizing the specific urban form and context of the Park Lawn GO Station.

The document will identify potential constraints in the roadway network and at critical intersections adjacent to the Park Lawn GO Station based on critical movements generated by the Station and provide recommendations for further improvements.

Additionally, a high-level pedestrian, cycling and transit qualitative analysis will be conducted through identification of any gaps in the facilities and services and recommendations made for consideration as part of the Near Term and Longer Term area planning efforts.

1.4 Ongoing Area Development and Infrastructure Planning Processes

In addition to the TPAP, there are currently a number of active planning processes for the area building towards the emergence of a transit orientated neighbourhood. This section provides an introductory overview of these processes and the proposed infrastructure improvements, with a more detailed outline provided in Section 3.

1.4.1 Area Development and Related Processes

The transportation and traffic operations in the Humber Bay Shores and South Etobicoke Area is primarily guided by the City, including the ongoing Christie's Secondary Planning process and Park Lawn Lake Shore TMP.

Significant study has also been advanced as part of the Official Plan and Zoning By-Law Amendment applications in support of a significant mixed-use, transit-orientated redevelopment of the 2150 Lake Shore Boulevard West (2150 Lake Shore) property located immediately adjacent to the Park Lawn GO Station.

These studies will provide a framework for the successful development of the area over the next 10 to 20 years as a community built from its inception as a workable transit orientated and sustainable community focussed on the Park Lawn GO Station. The studies are being advanced by and with the City to determine appropriate overall area development permission

thresholds, the area transportation system operations and supporting transportation infrastructure needs.

Notably, the Secondary Plan and Park Lawn Lake Shore TMP are ongoing studies which are anticipated to be completed over the course of 2021/2022. These studies will assess in detail the future area mobility needs of the area and assume the development of the GO Station in conjunction with the 2150 Lake Shore site. Detailed modelling of traffic and other mobility networks is being undertaken by the City as part of the Park Lawn Lake Shore TMP for a 2041 condition and information will be provided as part of the final reporting for this process currently scheduled for 2021/2022.

1.4.2 Potential Infrastructure Improvements

As part of the processes outlined above, a variety of new infrastructure is being contemplated to support the proposed area development. The principal elements are outlined below:

Roads

- Potential construction of Public Street A, which is a new east-west road link proposed to extend from the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection to the Lake Shore Boulevard West / The Marginal Boulevard intersection, primarily through the 2150 Lake Shore site;
- Construction of Public Street B (Loop Road) within the 2150 Lake Shore site;
- Potential construction of a Legion Road extension from its current southern limit near the Gardiner Expressway eastbound off ramp to Park Lawn Road, to its current northern limit near Lake Shore Boulevard West;
- Potential construction of a new north-south street extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street; and
- Potential adjustments to lane configurations resulting in two traffic lanes along Park Lawn Road.

Transit

- Construction of the Park Lawn GO Station;
- Construction of a mobility hub within the 2150 Lake Shore site, which is proposed to accommodate TTC services;
- Diversion of streetcar routes 501 and 508 into the mobility hub via the abovementioned Public Street B (Loop Road); and
- Separation of streetcar and traffic lanes along Lake Shore Boulevard West.

Active Transportation

- Construction of cycle tracks along Lake Shore Boulevard West, Park Lawn Road, The Queensway, the abovementioned new north-south street and Legion Road extensions, and within the 2150 Lake Shore site.
- Urbanization of surrounding streets, improving the pedestrian realm.
- Additional pedestrian crossings at proposed signalized intersections along Lake Shore Boulevard West and Park Lawn Road.
- Construction of high quality pedestrian facilities through the 2150 Lake Shore site.

1.5 Station Context Overview

The Park Lawn GO Station is planned as an urban station serving the large surrounding existing and planned populations, and is premised largely on walk-in and transit trips to and from the Station. The station will be integrated with Phase 1 of the 2150 Lake Shore development, with both being built together and facilities linked and connected. Phase 1 of the 2150 Lake Shore development as currently proposed includes in the order of 1,250 residential units, 5,360 square metres of retail and 23,680 square metres of office spread across two proposed blocks located directly to the southeast of the proposed Station and fronting Park Lawn Road (Blocks D1 and C). Phase 1 is also proposed to include the construction of the proposed Station Square adjacent to the Station.

No commuter parking is proposed. PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore Boulevard West development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

In addition, the aforementioned Transit Hub is proposed to incorporate a streetcar loop facility and layover space to provide a turnaround facility for the existing 501 Queen and 508 Lake Shore streetcar services, whilst buses are proposed to stop adjacent to the GO Station on Park Lawn Road.

2. Approach, Methodology and Assumptions

The following section outlines the high level approach, methodology and assumptions adopted for the purpose of this assessment.

2.1 Approach

Low levels of traffic generation are expected to be generated by the Park Lawn GO Station, noting the transportation context of the area and the urban “City” form being pursued to support local area transit-oriented development.

The following are relevant in this regard and will serve to limit traffic impacts of the Park Lawn GO Station:

- No commuter parking is to be provided at the Station;
- Ridership at the GO Station is forecast to be heavily reliant upon local area walk-in and transit based trips generated by the significant levels of existing and planned area development; and
- The GO Station will only generate a limited number of car-borne travel which will be related primarily to PUDO activity given its urban City location and context.

Given the above, this document will focus on providing information regarding activity forecasts and related technical transportation assessments that describe and evaluate the direct implications and impacts of the Park Lawn GO Station as follows:

- Outline and assess the Existing Conditions in the GO Station environs;
- Assess a Near Term Horizon Condition (2028 time-frame) in detail which will consider the implementation of the Park Lawn GO Station in the context of the currently approved area development and street network context and the first phases of development of the 2150 Lake Shore Master Plan; and
- Provide an overview of a Longer Term Horizon Condition (2041 time-frame) which will look at the longer term positioning of the GO Station in the context of the prospective substantial levels of future development in the area including changes contemplated to the area street network that are being addressed through other studies. This timeframe aligns with the horizon year for the modelling being undertaken as part of the Park Lawn Lake Shore TMP.

The Near Term horizon assessment is intended to be a detailed assessment of traffic operations in this time frame developed for the purposes of the TPAP, while the Longer Term horizon assessment is more qualitative in nature and provides a general overview of GO Station operations within the context of the evolving development context surrounding the station. As noted in Section 1.4.1, this development planning is the focus of considerable City and other agency planning efforts.

2.2 Methodology

Detailed Existing and Near Term Horizon assessments were undertaken for the TPAP, with a more qualitative review undertaken of the GO Station in the context of the potential future horizon that is being studied in detail as part of the Park Lawn Lake Shore TMP and specific development related studies. Specifically, in order to undertake the Existing, Near Term Horizon and Longer Term Horizon assessments, the following high level methodology was adopted.

2.2.1 Existing Conditions (2019)

The Existing Conditions assessment provides a detailed review of the existing transportation conditions in the area. A base year of 2019 was adopted, consistent with the date of the traffic counts and the 2150 Lake Shore Boulevard West traffic study and noting that 2020 and 2021 have been pandemic-affected. The assessment adopted the following methodology:

- Existing traffic, pedestrian, cycling and transit data was collected and collated in order to establish base Existing Conditions. Data related to traffic operations such as vehicle delay studies and intergreen studies were also collected and collated for the purpose of calibrating Existing Conditions, whilst existing traffic signal timings were obtained to determine existing signal phasing;
- Existing activity conditions within the Study Area were established for the AM and PM weekday peak hour periods on the basis of the abovementioned data;
- Traffic operations analysis of Existing Conditions were undertaken using Synchro analysis software, in accordance with City of Toronto guidelines; and
- A qualitative assessment of the current cycling, pedestrian and transit operations in the area was undertaken which identifies the current strengths and weaknesses on the area networks.

2.2.2 Near Term Horizon (2028)

The Near Term Horizon assessment provides a detailed review of the projected Near Term transportation conditions (aligning with expected station opening) and provides an assessment of the station impacts, adopting the following methodology:

- Information regarding planned area development applications and projects that are anticipated to be completed within the Near Term Horizon (i.e., 2028 time-frame) were reviewed based upon available City database sources and other policy documents. This includes a review of the first phase of development on the 2150 Lake Shore site;
- Activity related to the abovementioned planned area developments during the AM and PM peak hours were established from transportation studies submitted to the City of Toronto;
- Committed and planned area street, transit, active transportation network improvements and changes that will influence the Near Term Horizon transportation network operations and travel patterns were reviewed;

- Future traffic conditions were established for the AM and PM peak hours for the Near Term Horizon reflecting forecast traffic conditions on the existing and modified / planned street network considering existing traffic activity levels, new planned development activity, proposed changes to the area street and active transportation networks and transit service levels in the area;
- Travel demand forecasts related to the Park Lawn GO Station were established for the AM and PM peak hours at the Near Term Horizon to assess the implications and impacts of the Park Lawn GO Station; and
- Traffic operations analyses of Future conditions were undertaken using Synchro analysis software, in accordance with City of Toronto guidelines.

2.2.3 Longer Term Horizon (2041)

The Longer Term Horizon conditions are the subject of considerable study by the City as part of the Park Lawn Lake Shore TMP and area specific development approvals processes. These processes are ongoing and will determine the form and scale of area development proposed for the area and related supporting infrastructure.

The assessment provided as part of this Brief is focused on providing a high level overview and qualitative discussion of the GO Station within the broader development of the area. This is appropriate given that these processes are ongoing, that the station is not projected to generate substantial levels of traffic, that new development beyond the Near Term will build upon the implementation of the GO Station and that these studies are extensive and will consider the role / function of the station in the broader Longer Term. As such, the following methodology was adopted:

- A detailed review of ongoing planning proposals, processes and initiatives was undertaken, including new development statistics, a break down of the planned uses proposed, new streets and connections, new local transit facilities and other active network linkages;
- On the basis of the above, a qualitative review was undertaken regarding the operation and impacts of the Park Lawn GO Station in the Longer Term; and
- Recommendations are made with respect to required facilities in the Longer Term to support the GO Station including key pedestrian, cycling, and PUDO and how they may be provided in the context of development planning in the area.

2.3 Assumptions

Key assumptions in relation to the review of Existing, Near Term Horizon and Longer Term Horizon conditions are outlined as follows:

Existing Conditions (2019)

- Existing traffic, pedestrian, cycling and transit conditions were assumed based on the collected data. Traffic, pedestrian and cycling data was collected in 2019 . Signal timings and infrastructure were assumed based on the date of the traffic data.

Near Term Horizon (2028)

- The Near Term Horizon was assumed for a 2028 timeframe;
- The Near Term Horizon assumes the following planned development has been constructed (further details provided in the Near Term assessment in Section 4):
    - Phase 1 of the 2150 Lake Shore site;
    - Full build-out of the remainder of the partially constructed Humber Bay Shores development;
    - Full build-out of the Mimico-Judson Regeneration Area; and
    - Full build-out of developments located at 42 Park Lawn Road, 251 Manitoba Street and 2313 Lake Shore Boulevard West.
- The Near Term Horizon also assumes the following proposed key infrastructure is in place:
    - Construction of the Legion Road extension from its current southern limit near the Gardiner Expressway eastbound off ramp to Park Lawn Road, to its current northern limit near Lake Shore Boulevard West, as proposed by the City of Toronto; and
    - Construction of Public Street A.
- Transit is assumed to include the GO Station and TTC buses on Park Lawn Road adjacent to the station. Streetcars are assumed to continue to operate along Lake Shore Boulevard West, as per Existing Conditions.

Longer Term Horizon (2041)

- The Longer Term Horizon was assumed for a 2041 timeframe;
- In addition to the planned development assumed for the Near Term Horizon, the Longer Term Horizon assumes the full build-out of the 2150 Lake Shore site as being considered within the context of the Mr. Christie's Secondary Plan and the Park Lawn Lake Shore TMP;
- In addition to the key infrastructure assumed for the Near Term Horizon, the Longer Term Horizon also assumes the construction of the following infrastructure:
    - Construction of the new north-south street extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway and the associated realignment of the Gardiner Expressway ramps;
    - Construction of Public Street 'B' (Loop Road) within the 2150 Lake Shore site, accommodating the diversion of streetcar routes 501 and 508 into the mobility hub; and

- Urbanization of surrounding streets, including the construction of area bicycle infrastructure, the separation of streetcar and traffic lanes along Lake Shore Boulevard West and the lane configuration changes resulting in two traffic lanes along Park Lawn Road.

3. Background

The following section provides an outline of the planning and transportation planning context, as well as area studies and the redevelopment and transit oriented development (TOD) context of the area.

3.1 Planning and Transportation Planning Context

3.1.1 Overview

The transportation-related policy and planning regime strongly guides the way that the City of Toronto evolves, and responds to the changing transportation needs. In general, the planning regime reflects policy direction, initiatives, and investments that all prioritize transit-oriented development and the mobility and experience of people over the efficiency of car movement.

The presented framework of relevant policies and plans provide strong support for the mobility opportunities presented by the Park Lawn GO Station. Furthermore, related transit / sustainable transportation networks will support the evolving Humber Bay Shores community as it develops as the primary forms of transportation and mobility.

3.1.2 Provincial Policy Statement (2020)

The Provincial Policy Statement (PPS) provides policy direction on matters related to land use planning and development in Ontario. The PPS encourages the provision of transportation demand management (TDM) and TOD strategies within new developments to increase the efficiency of existing and planned transportation infrastructure. The PPS also encourages density being added to lands that adopt a mix of uses to promote non-auto based travel. This suggests limiting the number of vehicular trips, partially through reduced parking, being generated by the GO Station.

3.1.3 Growth Plan for the Greater Golden Horseshoe (2019)

The Places to Grow Plan outlines the importance of reducing reliance on the automobile and promoting non-auto modes. Planning for growth along transit corridors, adopting minimum density targets in major station areas, and integrating active transportation within the existing and planned street network (i.e., complete streets) are priorities that considers minimizing the provision of parking as an important strategy.

3.1.4 Ministry of Transportation Transit-Supportive Guidelines (2012)

The Ministry of Transportation (MTO) Transit-Supportive Guidelines support the use of TDM strategies, especially in close proximity to transit stations. This includes the reduction of parking requirements upon the adoption of TDM measures, the sharing of parking between uses and use of on-street parking during off-peak hours. This is fundamental to the Site with consideration to planning for the new GO Station.

3.1.5 Metrolinx Regional Transportation Master Plan (2041)

The Metrolinx 2041 Regional Transportation Plan sets out the planned future transportation network for the GTA that best supports intensification in accordance with sustainable transportation objectives. Additional rapid transit options (i.e., light rail), greater pedestrian

connections, and mixed-use density should be considered for the City of Toronto and the surrounding region. Emerging and established mobility hubs, such as the Site, should adopt such elements and minimize parking in areas that may be more efficiently utilized by more sustainable infrastructure.

3.1.6 City of Toronto's Official Plan

The City's Official Plan (OP) ensures that the City evolves, improves and realizes its full potential in areas such as transit, land use development, and the environment. Lake Shore Boulevard is defined as a priority transit corridor in the OP, where transit-supportive measures should be integrated into as-of-right-zoning, such as minimum development densities and minimum parking standards.

3.1.7 Waterfront Transit Reset Study (2016)

The Waterfront Transit Reset is a multi-phase study that was implemented in 2016 (in partnership with the City of Toronto and the TTC) to establish a vision and plan for a comprehensive transit network along the City's waterfront to the year 2041. The Study Area extends from the Long Branch GO Station and the Mississauga border in the west to Woodbine Avenue in the east, and south of the Queensway / Queen Street corridor to Lake Ontario.

The Waterfront Transit Reset Study is undergoing a significant transformation, with rapid growth in many precincts along the water's edge, including the Mimico and Humber Bay Shores area. The Site area includes a light rail transit (LRT) line along Lake Shore Boulevard that will connect more directly to downtown Toronto to the east, and continue to the City of Toronto border to the west. This will result in frequent and reliable surface transit travel to and from the downtown, which will also reduce the demand for auto use and parking.

3.1.8 City of Toronto 10-Year Cycling Plan and Update

In June 2016, the City of Toronto completed a comprehensive citywide review of the bicycle network to enhance and renew infrastructure for Toronto's cycling routes.

More recently in July 2019, the City undertook a Cycling Network Plan Update that serves as a comprehensive work plan and outlines the City's planned investments for cycling infrastructure. The Updated plan define new timeframes for coordination, accountability, and implementation plans for the City's future network. This Cycling Network Update now consists of a short-term (2019-2021) implementation program and long-term (2022 and beyond) proposed network for the City. The overall plan visually identifies the significant cycling projects that are completed, underway / in review, and planned – this serves as the primary foundation of the cycling network.

For the area around the Site, the Cycling Network 10-Year Plan includes a Major Corridor Study for Lake Shore Boulevard and the construction of a new off-street trail along Mimico Creek west of Park Lawn Road. The proposed improvements are generally intended to improve the network connecting to the existing Martin Goodman Trail running along Toronto's waterfront.

3.1.9 Official Plan Amendment (OPA) 231 Settlement (2013)

In 2013, City Council adopted an Official Plan Amendment (OPA 231) that introduced new economic policies for Toronto's employment lands. The City of Toronto recently reached a settlement with respect to the City of Toronto Official Plan Amendment No. 231 (herein referred to as "OPA 231"). This settlement led to the adoption of a Site and Area Specific Policy (SASP) for the 2150 Lake Shore site and the re-designation of these lands from Employment Industrial to Regeneration Area.

3.2 Area Studies

3.2.1 Overview

The transportation and traffic operations environment in the Humber Bay Shores and South Etobicoke Area is primarily guided by the City led and ongoing Christie's Secondary Planning process and Park Lawn Lake Shore TMP. Significant study has also been advanced as part of the Official Plan and Zoning By-Law Amendment applications in support of a significant mixed-use, transit-orientated redevelopment of the 2150 Lake Shore site located immediately adjacent to the Park Lawn GO Station.

These application processes are being advanced by and with the City to determine appropriate overall area development permission thresholds, the area transportation system operations and supporting transportation infrastructure needs. The Secondary Plan and Park Lawn Lake Shore TMP are anticipated to be completed over the course of 2021/2022.

The transportation assessments supporting these comprehensive municipal planning studies will assess and address the implications of the broad and significant levels of new development being considered in the area for all travel modes and are considering the substantial benefits of a new GO Station from an overall mobility perspective. These assessments will include all levels of traffic activity related to the Park Lawn GO Station and will consider those in the context of the future planned area street network and plans being developed to support area development.

Detailed descriptions of the relevant area studies are presented and summarized below.

3.2.2 Park Lawn Lake Shore Transportation Master Plan

The City of Toronto originally initiated the Park Lawn Lake Shore TMP in 2016 to evaluate and plan for transportation options that address existing deficiencies and accommodate increases in population and employment in the Park Lawn Road and Lake Shore Boulevard West area.

The Park Lawn Lake Shore TMP was subsequently paused prior to the resolution of the OPA 231 appeals to await information and input regarding the development potential for the 2150 Lake Shore site and the related prospect of a new Park Lawn GO Station.

With the settlement of the OPA 231 appeals, and with the commencement of the Christie's Secondary Planning Study in October 2019, the City has resumed work on the Park Lawn Lake Shore TMP to move the study objectives forward and to evaluate options to improve the area's transportation network including:

- Improved access to the street;
- Transit and active transportation network;
- Provision of additional connections across major physical barriers such as rail lines;
- Planning for investment in public transit, pedestrian and cycling networks; and
- Enhancing the quality of the streetscape and urban design elements of the public realm.

This process is currently advancing in parallel to the City-led Secondary Plan process and other infrastructure related processes.

The Study Area for the Park Lawn Lake Shore TMP is bound by Ellis Avenue to the east, Legion Road to the west, The Queensway to the north and Lake Ontario to the south. The Park Lawn Lake Shore TMP is reviewing a variety of potential active transportation, transit and road network improvements to address existing constraints and support future development, based on a horizon year of 2041.

Improvements being considered and reviewed as part of the Park Lawn Lake Shore TMP include (but are not limited to):

- Potential improvements along Park Lawn Road and Lake Shore Boulevard West, including dedicated transit priority lanes, improved pedestrian environment, upgraded cycling route, lane configuration changes and new signalized intersections;
- A potential new north-south street extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street. A potential new east-west street connecting from the Gardiner Expressway eastbound off ramp at Park Lawn Road to Lake Shore Boulevard West, via the 2150 Lake Shore site; and

3.2.3 Christie's Planning Study

City staff initiated the Christie's Planning Study to establish a comprehensive planning framework for a Study Area that is focussed primarily on the 2150 Lake Shore site and adjacent lands around the proposed location of the Park Lawn GO Station. The City is conducting a planning study to identify and establish certain aspects including (but not limited to): mobility and transit facility and infrastructure needs including the form of new transit infrastructure to support / inter-connect with the proposed Park Lawn GO Station, community services and facility needs including potential school and community centre provisions, and open space and park needs.

In October 2019, the Christie's Planning Study has prepared and submitted an initial OPA application, which presented a comprehensive mixed-use Master Plan development vision for the property. In May 2020, a revised OPA was submitted in response to the evolving development plan and comments received from City Staff and stakeholders. In conjunction with this, initial Zoning By-Law Amendment (ZBA) and Draft Plan of Subdivision applications were

prepared and submitted to provide a more refined review of the development details of the updated Master Plan. A subsequent revised submission was made in February 2021 in response to further comments received and the evolving development plan.

The Study Area for the above included Lake Shore Boulevard West between Legion Road and Windermere Avenue and Park Lawn Road between Humber Bay Park Road East and The Queensway.

Improvements proposed as part of the Christie's Planning Study include (but are not limited to):

- Improvements along Park Lawn Road and Lake Shore Boulevard West, including dedicated transit priority lanes, improved pedestrian environment, upgraded cycling route, intersection improvements and optimizations and new signalized intersections;
- Construction of a mobility hub within the 2150 Lake Shore site, which is proposed to accommodate TTC services;
- Construction of Public Street B (Loop Road) within the 2150 Lake Shore site, accommodating the diversion of streetcar routes 501 and 508 into the mobility hub; and
- Construction of the previously mentioned Public Street A, which is a new east-west road link proposed to extend from the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection to the Lake Shore Boulevard West / The Marginal Boulevard intersection, primarily through the 2150 Lake Shore site.

3.2.4 Mimico 20/20 Revitalization Action Plan

Following discussions between City Staff and area residents in 2006, the Mimico 20/20 project was brought forward as a long-term strategy to identify opportunities, challenges, and potential implementation mechanisms for the revitalization of the Lake Shore Boulevard corridor between Royal York Road and the Mimico Creek. The goal of the strategy aims to build on the area's strengths and create new opportunities for positive incremental change within and around the Study Area. From a transportation perspective, the vision of the Action Plan aims to ensure that movement systems for all types of users operate effectively.

Since this time, multiple actions have been undertaken, including community visioning workshops, public meetings, and case hearings and appeal settlements for the project.

3.2.5 Mimico-Judson Regeneration Areas

Subsequent to the City Council's adoption of OPA 231, it was proposed to re-designate the lands near the Mimico GO Station and a portion of lands west of Royal York Road to Regeneration Areas. The Regeneration Areas designation provides for a mix of employment, institutional and residential uses that are implemented through a Site and Area Specific Policy.

City Staff initiated a study for the Mimico-Judson Regeneration Area that provides a revitalization framework to accommodate employment and residential population growth which capitalizes on the land's proximity to the Mimico GO Station. The Study was intended to identify

opportunities and constraints presented by the existing development permissions, built form, community services provision and movement through the Study Area in order to unlock the potential of the Mimico-Judson area to provide for an appropriate mix of compatible uses.

3.2.6 Other Area Development Studies

In addition to the studies discussed above, various other studies have been prepared for developments proposed in the vicinity of the Study Area. Of particular note and relevance to this study is the Humber Bay Shores Mixed-Use Developments, which is in close proximity to the Study Area.

The Humber Bay Shores Mixed-Use development primarily relates to the lands bound by Lake Shore Boulevard West to the north, Marine Parade Drive to the west and south and Brookers Lane to the east. The proposal comprised in the order of 5,300 residential units and 24,000 square metres of commercial. As of the date of this report, the development is partially constructed.

3.2.7 Legion Road Extension

A Municipal Class EA Study was undertaken in 2009 to develop alignment options for the extension of Legion Road. The study recommended the extension of Legion Road from its northern limit to the Gardiner Expressway eastbound off ramp at Park Lawn Road using a single portal tunnel under the CN rail corridor and was approved by the Ministry of Environment in 2010.

The project is currently in the early stages of detailed design. In parallel, the traffic impact of this road connection is also being studied within the Park Lawn Lake Shore TMP to ensure that the connection is meeting project objectives in the current and future conditions.

3.3 Redevelopment Context and Transit-Oriented Development Opportunity

The construction of the Park Lawn GO Station provides a substantial opportunity to create a transit focussed community within southern Etobicoke that will benefit existing residents and support prospective new development.

This is particularly of consequence in the context that based upon current infrastructure, the emerging Humber Bay Shores area is planned to become the home for over 25,000 people as it builds out over the next few years in addition to a broader area population of 50,000+ people. This is based upon existing and future area development and would create substantial ridership and activity at the Park Lawn GO Station.

Central to this is the redevelopment of the 2150 Lake Shore property, in addition to other planned area development such as the partially constructed Humber Bay Shores mixed-use development.

The 2150 Lake Shore development plan is seen as a highly transit orientated mixed-use plan. The development plan is strongly guided by the Master Plan (MP), which aims to directly respond to the existing area transportation challenges and create a mobility context for the area focused upon establishing transit, cycling and pedestrian travel as the primary travel modes for

the Site and surrounding area. These overall objectives will enable the long term area transportation demands and broader area to be met into the future.

Significant residential, employment (office) and retail uses are proposed as part of the 2150 Lake Shore proposal which from a travel perspective, is centred around the Park Lawn GO Station and associated mobility hub. In the order of 7,500 residential units, 63,000 square metres of office gross area uses, 36,000 square metres of retail floor area and two schools with a combined enrolment of 1,100 students are currently proposed as part of the 2150 Lake Shore proposal.

Further to the above is the substantial existing development in the immediate area (estimated to be in the order of 7,000 residential units plus some ground floor commercial), as well as other planned future development in the immediate area (estimated to be in the order of 3,500 residential units plus some ground floor commercial). In addition, the new Park Lawn GO Station will be directly connected to various key transportation and mobility elements of the 2150 Lake Shore redevelopment, including:

- Creation of a Transit Hub at the new GO Station with new TTC LRT and bus facilities;
- New dedicated LRT track facilities connecting Lake Shore Boulevard West to the Transit Hub, as well as dedicated LRT tracks on Lake Shore Boulevard West;
- Enhancement of cycling infrastructure and provision of end-of-trip facilities and bike share services in the area;
- A series of complete streets and new main street signalized crossings that promote walking as a viable local travel mode; and
- Car share facilities and other complementary programmes, including existing car share facilities in the area and potential car share being considered as part of the 2150 Lake Shore development.

It is noted that the primary infrastructural change includes the planned multi-modal transit hub, which will be located at the new Park Lawn GO Station, with integrated transit services, as well as other travel modes. The transit hub, collectively with the support for active transportation infrastructure and facilities are expected to generate an abundance of long and short non-auto trips at the Station, throughout the Site, and between adjacent communities.

The Site in the context of the 2150 Lake Shore MP is shown in Figure 3-1, whilst the new major transportation infrastructure elements and the transit hub proposed as part of the 2150 Lake Shore development are shown in Figure 3-2.

Figure 3-1: 2150 Lake Shore Master Plan

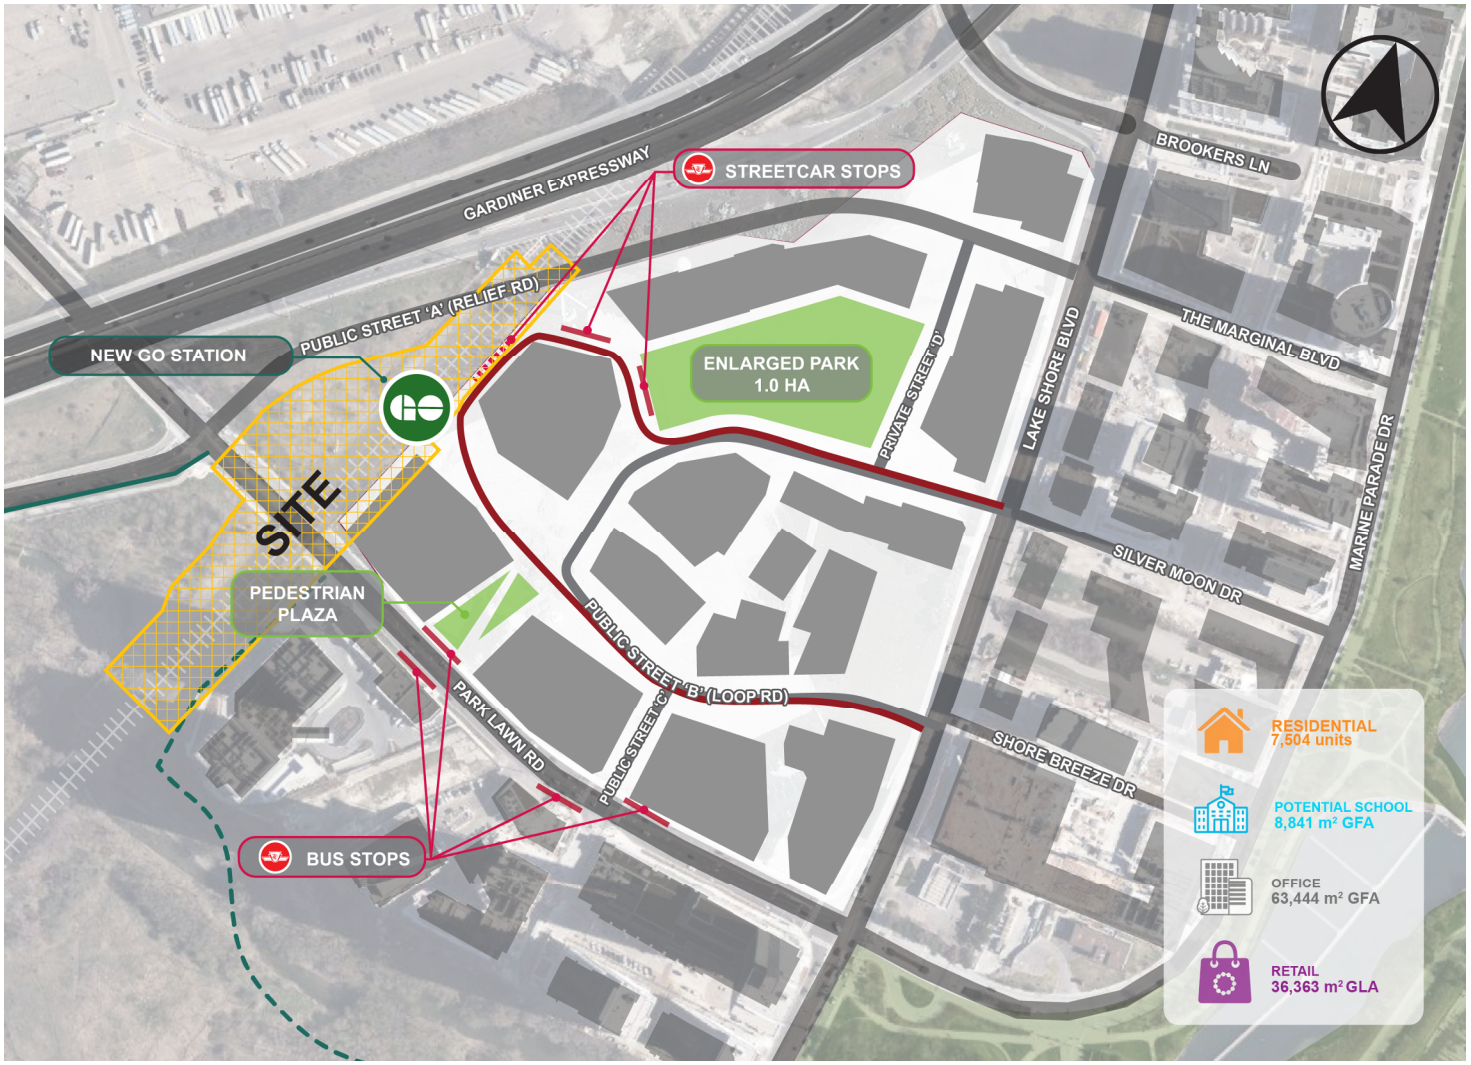

Figure 3-2: Major Transportation Infrastructure Proposed as Part of 2150 Lake Shore Development

4. Existing Conditions

4.1 Existing Traffic Conditions

4.1.1 Existing Road Network

The new GO Station Site is adjacent to the Gardiner Expressway and is north of Lake Shore Boulevard West; two major east-west arterials that cross the City of Toronto. Ramps providing access from the Gardiner Expressway are available on Park Lawn Road in close proximity to the Site. Existing capacity constraints result in congestion along the Park Lawn Road and Lake Shore Boulevard West corridors during the weekday peak periods.

Currently, Park Lawn Road is the only north-south connection in the vicinity of the Site and the Humber Bay Shore community. As a result, the Park Lawn Road corridor can become congested during the peak periods due to high demands for movement on and off the Gardiner Expressway, as vehicles by-pass traffic on the expressway.

Descriptions of the proposed GO Station's immediate road network is summarized below. The existing area road network context is illustrated in Figure 4-1 and the existing area road network lane configurations are illustrated in Figure 4-2.

Gardiner Expressway

The Gardiner Expressway ("Gardiner") is a City expressway that extends from Highway 427 in the west (where it continues as the Queen Elizabeth Way) to the Don Valley Parkway in the east, where it continues in a north-south orientation.

The Gardiner passes directly north of the Site and serves as a major regional transportation connection. In the vicinity of the Site, the Gardiner generally maintains three lanes eastbound and four lanes westbound of general purpose traffic, with a posted speed limit of 90 kilometres per hour.

Lake Shore Boulevard West

Lake Shore Boulevard is a major arterial roadway that extends from Etobicoke Creek in the west across downtown Toronto to the Eastern Beach area of Toronto. Within the vicinity of the Site, Lake Shore Boulevard West generally operates with a four-lane cross section, with the central lanes functioning as shared traffic / streetcar lanes. A posted speed limit of 50 kilometres per hour applies in the vicinity of the Site.

Park Lawn Road

Park Lawn Road is a major arterial north-south roadway with a four-lane cross section in proximity to the Site, extending from South Kingslea Drive to the north to Lake Shore Boulevard West to the south. The roadway provides limited cycling facilities (i.e., sharrows) in the north. Park Lawn Road intersects with the Lakeshore GO rail line as an underpass.

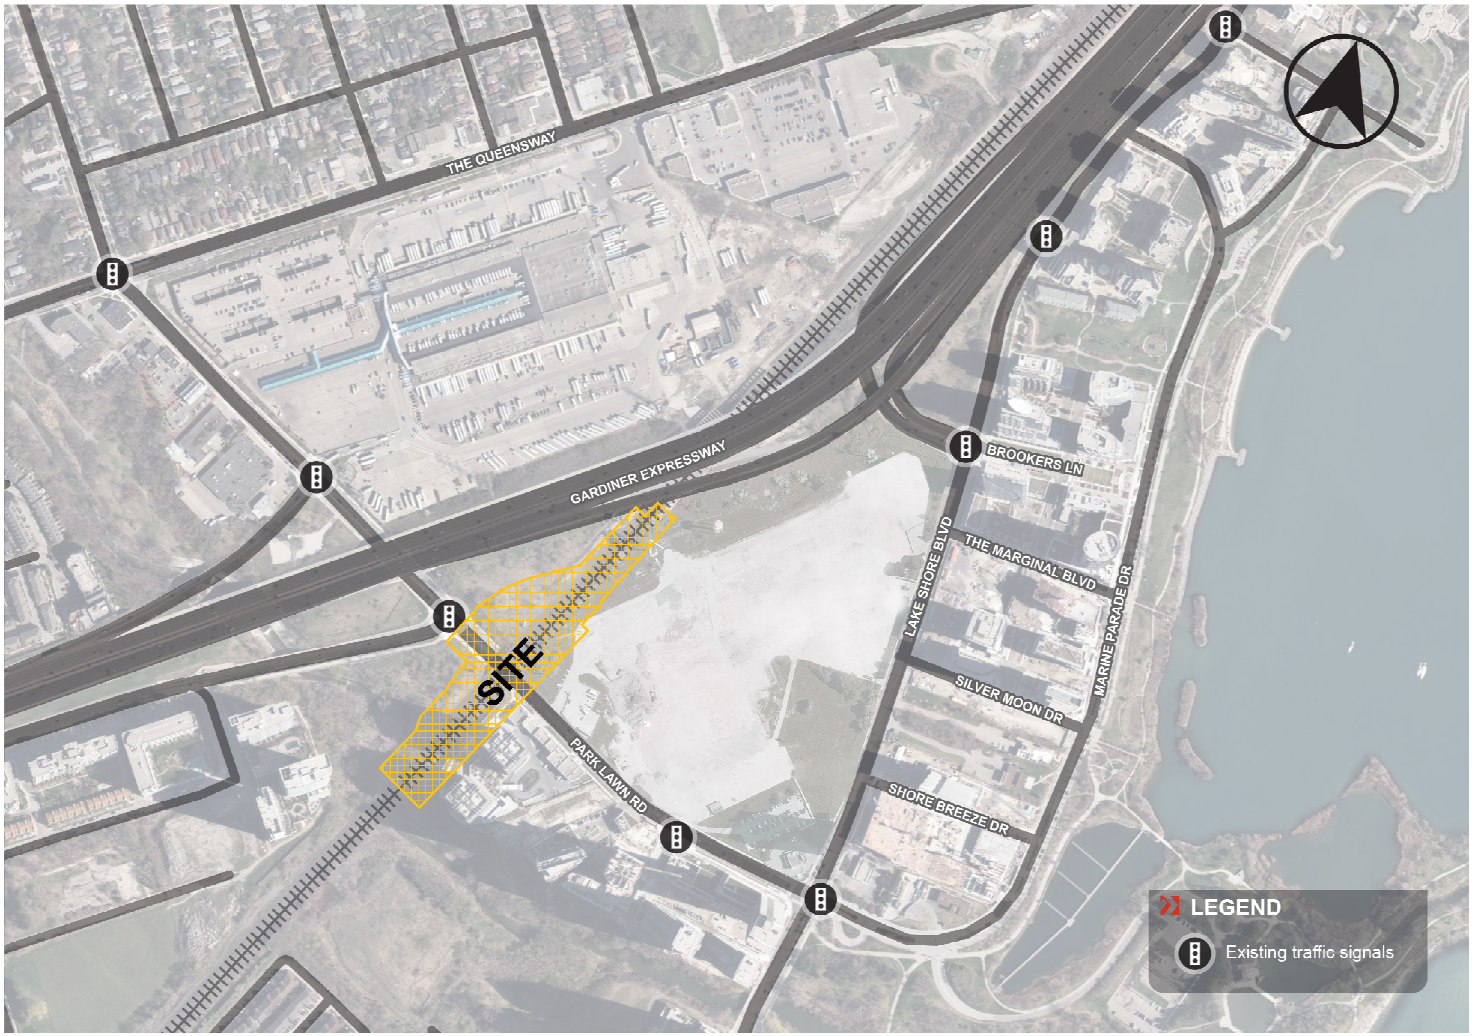

Figure 4-1: Existing Area Road Network Context

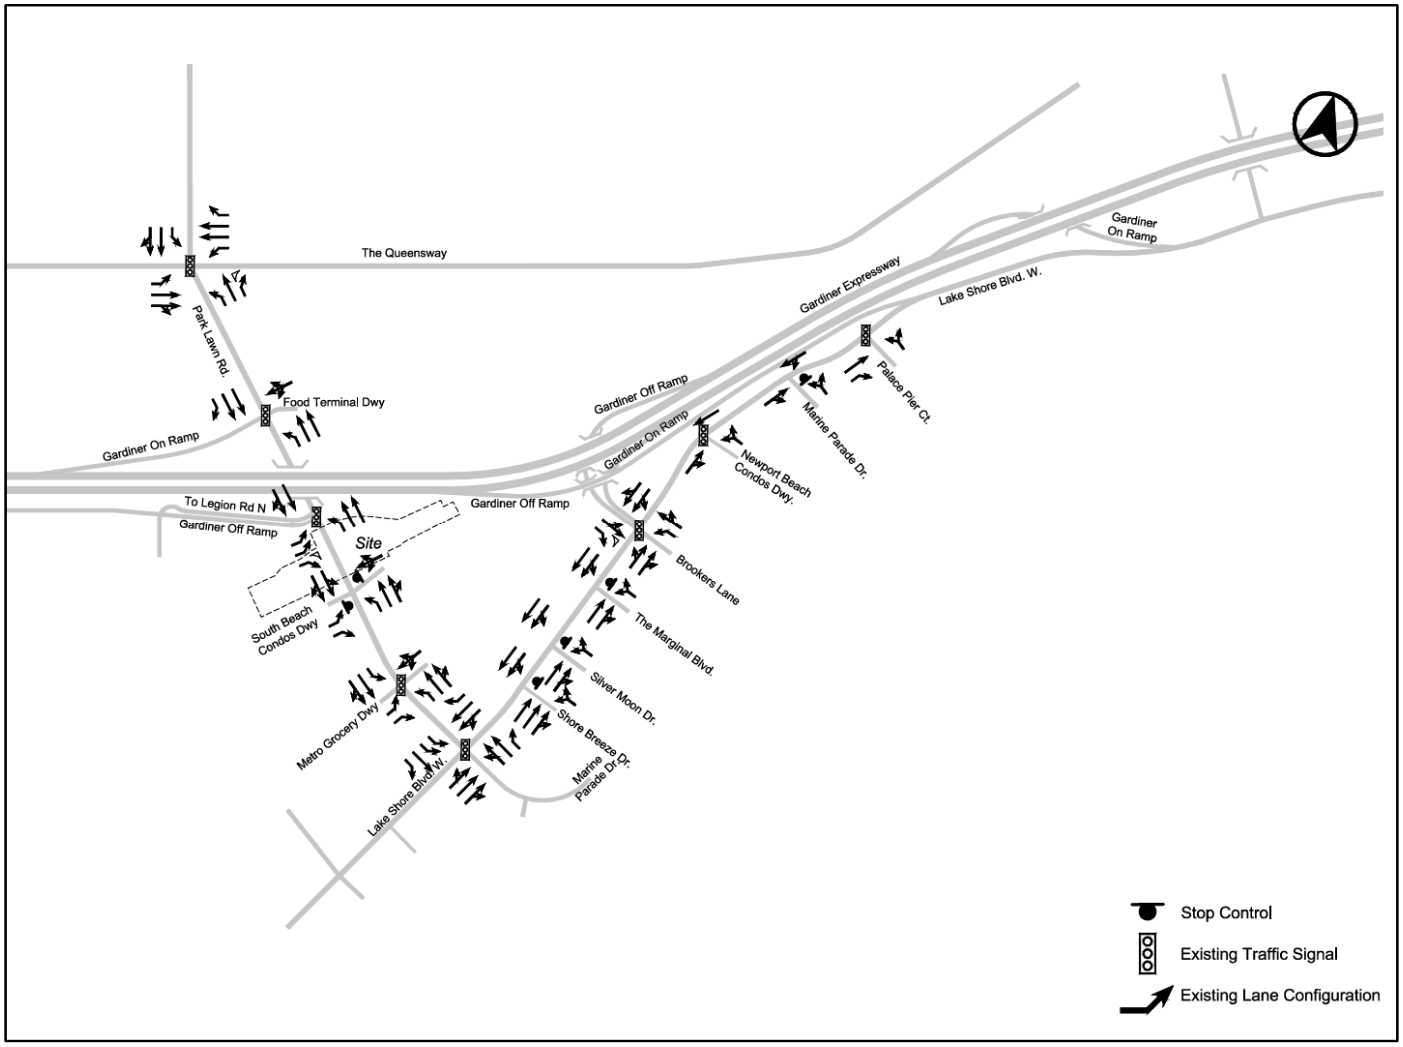

Figure 4-2: Existing (2019) Area Road Network Lane Configurations

4.1.2 Existing Area Car Share Services

There are three primary car sharing companies operating in Toronto (Zipcar, Enterprise CarShare and Communauto), which offer their members access to vehicles located around the City of Toronto.

Zipcar is the world's largest car sharing program, which entered into the Toronto market in 2006 with approximately 100 vehicles; it has since grown to approximately 500 vehicles.

Toronto-based Enterprise CarShare (formerly AutoShare), founded in 1998, currently has over 12,000 members and 300 vehicles at over 150 locations across the City.

The above programs have acquired parking spaces for their vehicles either in private garages / surface lots or within Toronto Parking Authority (TPA) lots. Vehicles rented from these programs must be picked up and returned from the same parking space.

The Communauto service is currently operating a pilot program within the downtown Toronto area that commenced in November of 2018. The fleet size currently includes 200 'free-floating' vehicles and will be expanded upon successful completion of the pilot. Communauto vehicles are permitted to park within on-street residential permit parking zones, with users made aware of available vehicle locations using the Communauto mobile app.

There are currently two car share locations in the vicinity of the Site, operated by Enterprise CarShare, which are located adjacent to Park Lawn Road (to the west) between Lake Shore Boulevard and the Gardiner Expressway ramps, and adjacent to Lake Shore Boulevard (to the south) between Park Lawn Road and the Gardiner Expressway ramps (2175 Lake Shore Boulevard West).

4.2 Existing Active Transportation Conditions

4.2.1 Existing Active Transportation Network

The Site is located in proximity to some of Toronto's largest active transportation facilities. The Humber Bay Park East Trail, which is an extension of the Martin Goodman Trail, is located directly south of the Site and runs along the shoreline of Lake Ontario. The Martin Goodman Trail is one of the most extensive multi-use trail systems in Toronto. It extends along the waterfront, connecting the west and east ends of Toronto along the water via central Toronto.

There are also a number of active recreation facilities in the area that can be utilized on foot or bike. The Humber Bay Shores Park, the Humber Bay Park East and West Parks, and the Jean Augustine Park, are all located within 750 metres of the Site.

Apart from the multi-use trails, there are limited cycling options in the vicinity of the Site, as the street network is constrained by the Gardiner Expressway and GO Transit line. Similarly to the road network, there are limited cycling connections in the north-south direction.

North of the Gardiner Expressway, there are bicycle sharrows on Park Lawn Road and bicycle lanes on the Queensway, east of Stephen Drive. However, the lack of north-south cycling connections make these routes difficult to reach from the Site.

Existing sidewalks are generally provided along both sides of Park Lawn Road and Lake Shore Boulevard West in the vicinity of the Site to facilitate pedestrian movement within the surrounding area, with crosswalks provided at signalized intersections.

However, it is noted that the 2150 Lake Shore site is currently a large, impermeable block, which prevents through connections. In addition, a gap in the pedestrian network is noted along the north side of Lake Shore Boulevard, east of The Marginal Boulevard.

4.2.2 Existing Area Bike Share Services

The Bike Share Toronto program provides flexible cycling options within the City of Toronto with bicycles that can be used on a short term basis and picked up/dropped off at any station across the City. The system underwent an expansion in 2016 which expanded the network to include 1,000 bicycles and 120 stations including new stations along the Yonge and Bloor/Danforth transit corridors and as far north as St Clair Avenue West. There is a continued effort to expand the network and locate new stations along major corridors in conjunction with other investments in cycling infrastructure.

There is currently a Bike Share station just south of the Site on Marine Parade Drive, and two other stations within close proximity of the Site.

The existing area active transportation context is illustrated in Figure 4-4.

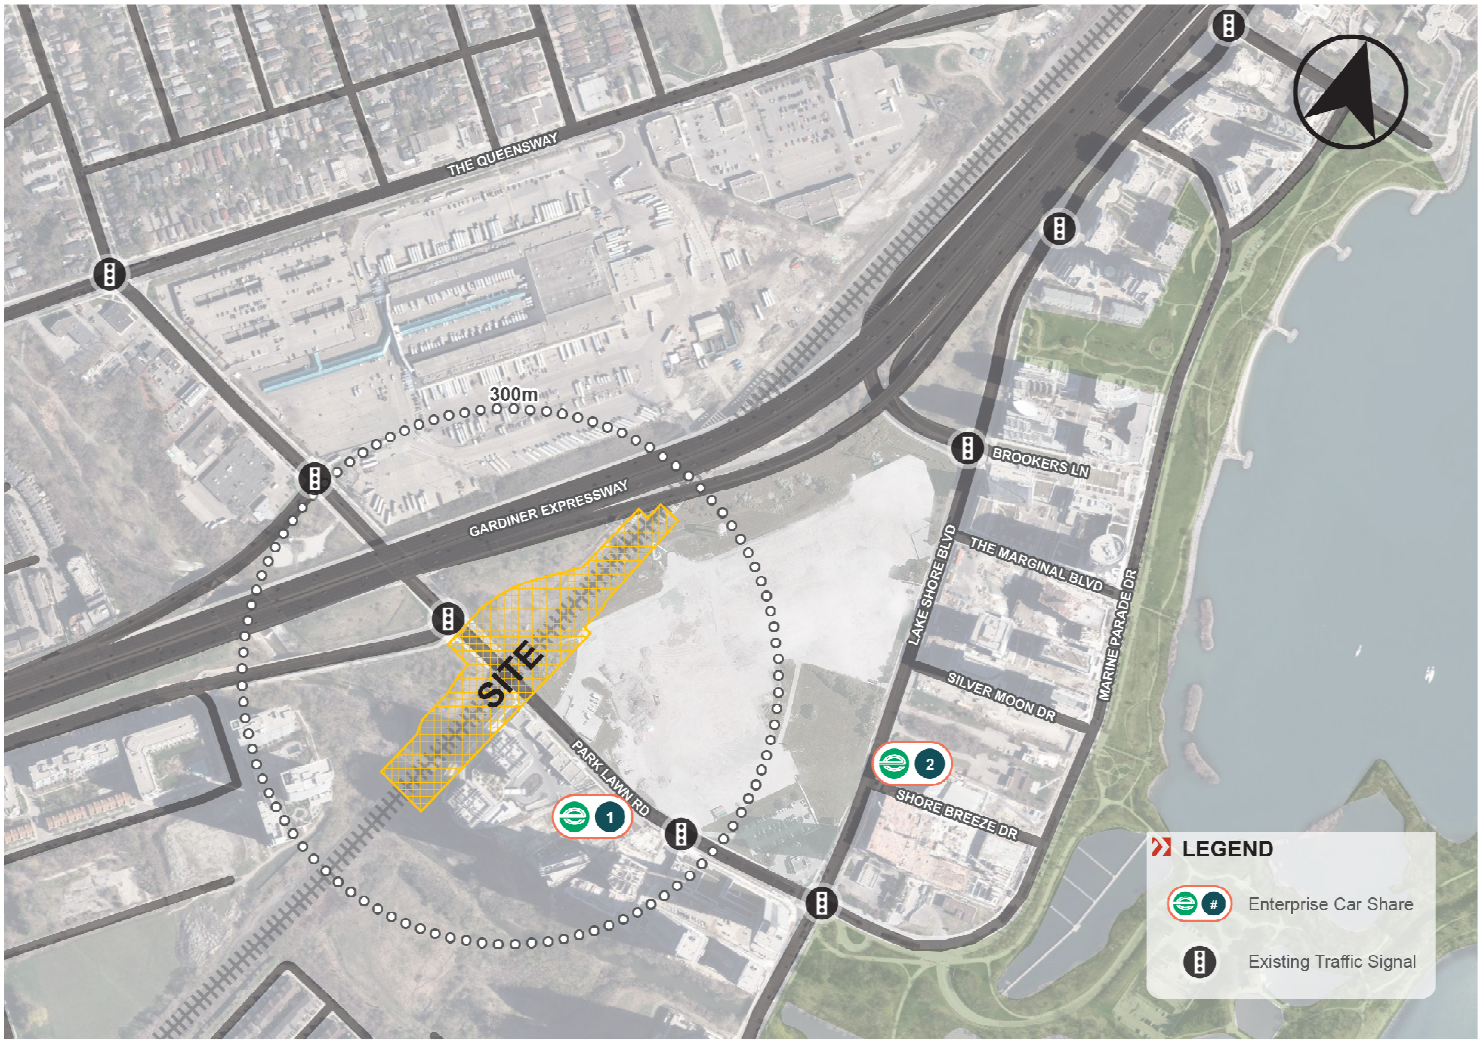

Figure 4-3: Existing Area Car Share

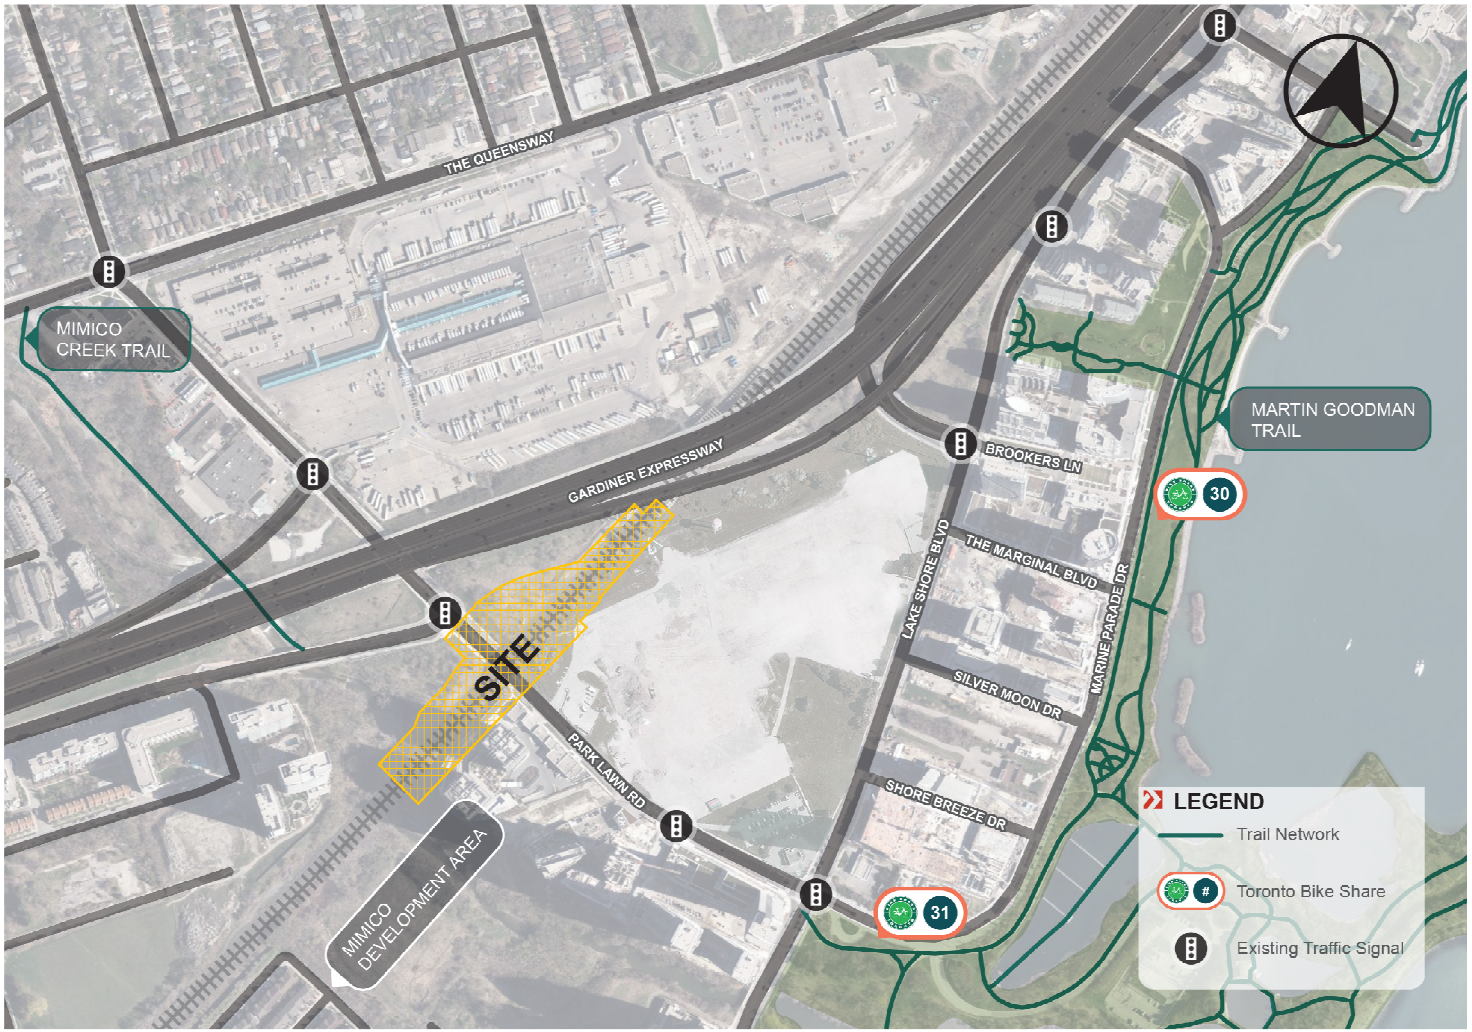

Figure 4-4: Existing Area Active Transportation Context

4.2.3 *Existing Cycling Volumes*

Existing traffic count information was collected and is outlined in further detail in Section 4.4.2. The traffic count information included bicycle volumes at each intersection surveyed.

Based on the bicycle data within the traffic count information outlined above, it is estimated that in the order of 10 cyclists travel along Lake Shore Boulevard West and Park Lawn Road in the morning and afternoon peak hours.

4.2.4 *Existing Conditions Cycling Assessment*

4.2.4.1 *Review Criteria*

A qualitative review of the bicycle infrastructure located within the vicinity of the Site was undertaken. The review considered the following assessment criteria:

Bicycle Parking:

- The Site must have an adequate bicycle parking supply, inclusive of short-term bicycle parking that is located in highly visible and publicly accessible locations.

Sharing:

- Bike Share Toronto facilities can be conveniently located on-Site or in close proximity; bike sharing is especially preferable adjacent to, or located in close proximity to, higher order transit stations.

Connecting:

- It is beneficial if the Site is well-connected as part of the City of Toronto's cycling network via infrastructure that is safe, convenient, and has high capacity; and
- Protected bike lanes (i.e., cycle tracks) and multi-use paths are preferable in this regard.

Support:

- Bicycle repair stations provided on-Site are an amenity that adds convenience to local cycling; and
- At local buildings, important information regarding cycling routes, amenities, and safety tips should be shared to spread awareness and to promote cycling.

4.2.4.2 *Evaluation Results*

Cycling Volumes:

- The cycling volumes in the immediate vicinity are currently low, noting the lack of on-road cycling infrastructure in the area.

Parking/Sharing:

- An existing Toronto Bike Share Station is located near the Site; and
- Existing bicycle parking opportunities in the vicinity of the Site are currently limited.

Connecting:

- The Site is located in close proximity to a number of existing off-road trails and recreational facilities, including the Humber Bay Park East Trail, the Humber Bay Shores Park, the Humber Bay Park East and West Parks and the Jean Augustine Park; and
- Existing on-road bicycle infrastructure is currently limited, with bicycle sharrows on Park Lawn Road and bicycle lanes on the Queensway, east of Stephen Drive.

Support:

- There is currently limited bicycle support facilities in the vicinity of the Site.

4.2.5 Existing Pedestrian Volumes

The abovementioned traffic count information also included crossing pedestrian volumes at each intersection surveyed.

Based on the pedestrian data within the traffic count information, it is estimated that in the order of 200 pedestrians walk along Lake Shore Boulevard West in the morning and afternoon peak hours and in the order of 100 pedestrians walk along Park Lawn Road in the morning and afternoon peak hours.

4.2.6 Existing Conditions Pedestrian Assessment

4.2.6.1 Review Criteria

A qualitative review of the pedestrian infrastructure located within the vicinity of the Site was undertaken. The review considered the following assessment criteria:

Walking:

- Pedestrian facilities are wide enough to allow pedestrians to walk and pass comfortably with expected pedestrian volumes;
- Walking paths have minimal and manageable interaction with vehicular crossings (i.e. Driveways, laneways, etc.);
- Adequate lighting is provided along pedestrian facilities; and
- Width of sidewalks, walkways, stairs, ramps and other pedestrian facilities is maintained during winter/snow removal conditions.

Waiting:

- Pedestrian waiting facilities provided at intersections should be designed to accommodate the volume of pedestrians expected to accumulate between crossing cycles and minimize pedestrians' exposure to hazards; and
- Actuated/callable pedestrian signals are provided at signalized crossings.

Crossing:

- Formal pedestrian crossings are provided at the intersections or desired locations of crossing;
- Formal crossings in the area's pedestrian network provide efficient routes for pedestrians to cross to reach desired destinations and discourage jay-walking or informal crossings; and
- Crosswalks are wide enough to accommodate expected two-way crossing volumes.

Connecting:

- Pedestrian facilities make up a well-connected network providing a high level of area coverage without "gaps" or disconnected links in the network; and
- Pedestrian facilities provide efficient routes between key destinations.

Accessible:

- Pedestrian facilities are available to all regardless of age or ability and are designed to be accessible, where possible, and practical.

4.2.6.2 Evaluation Results

Pedestrian Volumes:

- Given the existing development in the area, existing pedestrian volumes are notable, within the order of 200 pedestrians estimated along Lake Shore Boulevard West in the morning and afternoon peak hours and 100 pedestrians estimated along Park Lawn Road in the morning and afternoon peak hours.

Walking:

- Portions of Park Lawn Road have insufficient sidewalk widths of less than 2 metres.

Waiting/Crossing:

- Formal pedestrian crossings exist at signalized intersections; and
- Distance between some existing signalized intersections is in the order of 300 - 400 metres.

Connecting:

- Existing sidewalks are generally provided along both sides of Park Lawn Road and Lake Shore Boulevard West in the vicinity of the Site;
- The current network generally lacks pedestrian crossing opportunities, particularly mid-block connections;
- There is a gap in the pedestrian network along the north side of Lake Shore Boulevard, east of The Marginal Boulevard; and

- The 2150 Lake Shore site is currently a large, impermeable block which prevents through connections.

Accessible:

- Intersections in the vicinity of the Site generally accommodate all patrons regardless of age or ability.

4.3 Existing Transit Services

4.3.1 Existing Area Transit Context

The Site is well situated relative to existing local surface transit routes. Within close proximity to the Site, local routes operated by the TTC include the 501 Queen Streetcar, the 508 Lake Shore Streetcar and surface bus routes. The area primarily relies upon the streetcar routes, which run along Lake Shore Boulevard West and provide service to Long Branch GO Station and downtown Toronto. The surface bus routes offer connections to stations along the Bloor-Danforth subway line (Line 2) and downtown Toronto.

The nearest existing station on the Lakeshore West GO line is the Mimico GO Station, which is approximately 1.5 kilometres to the west of the Site. Mimico GO Station has parking facilities and the 176 Mimico GO bus route provides peak hour service from the Humber Bay Shores area to Mimico GO Station.

Descriptions of the Site's area transit routes are summarized below. The existing area transit context is illustrated in Figure 4-5.

Lakeshore West GO Line

The Lakeshore West GO line operates between Union Station and Hamilton, and Niagara Falls with all-day, two-way service to Aldershot, and currently includes a stop approximately 1.5 kilometres west of the Site at the Mimico GO Station. Local train service is provided regularly from Monday to Friday and provides convenient high-level transit connections to downtown Toronto and to / from the west. During peak hours, service is currently provided at 15 minute intervals.

Service along this route has recently undergone enhancements based upon Metrolinx's and the City of Toronto's GO Expansion and SmartTrack initiatives.

501 Queen Streetcar Route

The 501 Queen Streetcar route operates between Neville Park Loop, Humber Loop and Long Branch Loop, generally in an east-west direction. It serves the Queen and Osgoode Stations on the Yonge-University-Spadina subway line (Line 1). This route is part of TTC's '10-Minute Network', offering service with headways within 10 minutes all day and on every day, with intervals during the peak hours in the order of 4-5 minutes.

508 Lake Shore Streetcar Route

The 508 Lake Shore Streetcar route operates between Long Branch Loop and the area of King Street East and Parliament Street, generally in an east-west direction. It also serves the St. Andrew and King Stations on Line 1 subway line.

The service operates five eastbound only trips during the morning peak period and five westbound only trips during the afternoon peak period, from Monday to Friday only, at intervals in the order of 20 minutes

66 Prince Edward Bus Route

The 66 Prince Edward bus route operates between Old Mill Station on the Line 2 subway line, the area of The Queensway and Stephen Drive, and the area of Lake Shore Boulevard West, Park Lawn Road, and Marine Parade, generally in a north-south direction. The service operates all day, every day, with intervals during the peak hours in the order of 6 minutes.

80 Queensway Bus Route

The 80 Queensway bus route operates between the Sherway Gardens shopping mall, the area of The Queensway and Stephen Drive, and Keele Station on the Line 2 subway line, generally in an east-west direction. The service operates all day, every day, with intervals during the peak hours in the order of 30 minutes.

145 Downtown/Humber Bay Express Bus Route

The 145 Downtown/Humber Bay Express bus route operates between the Humber Bay area in south Etobicoke and the Downtown Toronto area, generally in an east-west direction. The service operates during peak periods Monday to Friday, with intervals in the order of 30 minutes.

176 Mimico GO Bus Route

The 176 Mimico GO bus route operates between Mimico GO Station and Lake Shore Loop, generally in an east-west direction. The service operates during peak periods Monday to Friday, with intervals in the order of 30 minutes.

Figure 4-5: Existing Area Transit Context

4.3.2 *Existing Area Transit Peak Hour Service and Ridership*

A summary of the existing peak hour service and ridership of the transit routes operating in the vicinity of the Site is provided in Table 4-1.

The TTC ridership data is attached in Appendix A.

Table 4-1: Existing Area Transit Peak Hour Service and Ridership

Route	Direction	Reference Stop	AM Peak Services	PM Peak Services	AM Peak Ridership	PM Peak Ridership
Lakeshore West GO Train	Eastbound	Mimico Station	3	2	3,000	618
	Westbound		3	2	361	2,176
Streetcar 501	Eastbound	Park Lawn / Lake Shore	6	6	285	172
	Westbound		6	6	131	298
Streetcar 508	Eastbound	Park Lawn / Lake Shore	3	-	-[1]	
	Westbound		-	3		
Bus 66	Northbound	Park Lawn / Lake Shore	6	7	218	67
	Southbound		6	7	42	159
Bus 80	Eastbound	The Queensway / Park Lawn	2	2	43	56
	Westbound		2	2	84	48
Bus 145	Eastbound	Park Lawn / Lake Shore	2	3	56	-[1]
	Westbound		3	3	2	32
Bus 176	Eastbound	Park Lawn / Lake Shore	2	2	8	11
	Westbound		2	2	9	4

Notes:
1. Existing ridership data not available

4.3.3 *Existing Conditions Transit Assessment*

4.3.3.1 *Review Criteria*

A qualitative review of the transit infrastructure located within the vicinity of the Study Area was undertaken. The review considered the following assessment criteria:

Availability:

- Higher order transit service is highly available to the Site, with stations located in close proximity; and
- Transit options facilitate City-wide transit accessibility with minimal or no transfer required between routes.

Access:

- Adjacent or nearby transit stops offer convenient and accessible entrance and exit, and do not encourage jaywalking activity; and
- Multiple access points are preferable.

Capacity:

- There is capacity for the existing transit services to accommodate an increase in transit usage; and
- Where capacity is limited, plans are in place to alleviate capacity concerns via service expansion and/or the construction of new higher order transit route(s).

Operations:

- Bus stops have transit shelters;
- Surface transit routes are well integrated with general traffic network; and
- Preferably, the Site is functionally integrated with adjacent higher order transit station, facilitating seamless access to stations.

4.3.3.2 Evaluation Results

Availability:

- A number of streetcar and bus routes currently operate in the vicinity of the GO Station, with streetcar routes 501 (Queen) and 508 (Lake Shore) and bus routes 66 (Prince Edward), 145 (Downtown / Humber Bay Express), 176 (Mimico GO) operating along Park Lawn Road and/or Lake Shore Boulevard West in close proximity to the Site;
- GO Train service is currently available via Mimico Station, located approximately 1.5 kilometres to the west of the Site;
- Regarding transfers, it is noted that Transportation Tomorrow Survey (TTS) data indicates that in the order of 60 percent of transit trips to/from the Study Area are to/from areas of Downtown or Midtown Toronto which are broadly accessible via either streetcars 501 and 508 (no transfer required) or subway (1 transfer required) and another 25 percent of transit trips to/from the Study Area are to/from south and central areas of Etobicoke; and
- The TTS data also indicates that in the order of 40 percent of transit trips to/from the Site area comprise zero transfers, whilst in the order of 30 percent of transit trips to/from the Site area comprise one transfer.

Access:

- Existing bus and streetcar stops are located along Park Lawn Road and Lake Shore Boulevard West, with signalized intersections in the area providing crossing locations for pedestrians.

Capacity:

- Transit services within the vicinity currently operate within capacity.

Operations:

- Existing bus and streetcar stops in the vicinity are generally accompanied by a shelter; and
- Existing bus and streetcar services currently generally operate in mixed traffic conditions.

4.4 Existing Traffic Operations Assessment

4.4.1 Scope

Traffic analysis has been completed for existing traffic conditions during the AM and PM peak hour.

Intersections in the vicinity that have been included within the analysis Study Area are as follows:

- Park Lawn Road / The Queensway (Signalized);
- Park Lawn Road / Gardiner Expressway Westbound On Ramp / Ontario Food Terminal Driveway (Signalized);
- Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road (Signalized);
- Park Lawn Road / South Beach Condos Driveway / 2150 Lake Shore Driveway (Unsignalized);
- Park Lawn Road / Metro Grocery Driveway / 2150 Lake Shore Driveway (Signalized);
- Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive (Signalized);
- Lake Shore Boulevard West / Shore Breeze Drive (Unsignalized);
- Lake Shore Boulevard West / Silver Moon Drive (Unsignalized);
- Lake Shore Boulevard West / The Marginal Boulevard (Unsignalized);
- Lake Shore Boulevard West / Brookers Lane / Gardiner Expressway Eastbound On Ramp / Gardiner Expressway Westbound Off Ramp (Signalized);
- Lake Shore Boulevard West / Newport Beach Condos Driveway / Humber Loop (Signalized);
- Lake Shore Boulevard West / Marine Parade Drive (Unsignalized); and
- Lake Shore Boulevard West / Palace Pier Court (Signalized).

4.4.2 *Existing Traffic Volumes*

Existing traffic volumes at area intersections have been established based on traffic count information collected, as summarized in Table 4-2. Traffic count data sheets reviewed as part of this study are provided in Appendix B.

Table 4-2: Traffic Data Collection Summary

Intersection	Source	Date and Time
Park Lawn Rd / The Queensway	Accu-Traffic Inc.	Thursday June 6, 2019 7:30am-9:30am 4:00pm-6:00pm
Park Lawn Rd / Gardiner WB On Ramp / Ontario Food Terminal Dwy		
Park Lawn Rd / Gardiner EB Off Ramp / Legion Rd		
Park Lawn Rd / South Beach Condos Dwy / 2150 Lake Shore Dwy		
Park Lawn Rd / Metro Grocery Dwy / 2150 Lake Shore Dwy		
Lake Shore Blvd W / Park Lawn Rd / Marine Parade Dr		
Lake Shore Blvd W / Shore Breeze Dr		
Lake Shore Blvd W / Silver Moon Dr		
Lake Shore Blvd W / The Marginal Blvd		
Lake Shore Blvd W / Brookers Ln / Gardiner EB On Ramp / Gardiner WB Off Ramp		
Lake Shore Blvd W / Newport Beach Condos Dwy / Humber Loop		
Lake Shore Blvd W / Marine Parade Dr		
Lake Shore Blvd W / Palace Pier Crt		

Further to the above, traffic counts at area intersections have been undertaken on multiple occasions to ensure existing baseline traffic conditions are representative. As such, to determine whether the collected traffic volume set (2019) is generally in line with typical volumes within the area, it was compared against additional counts previously undertaken between 2011-2018. The volumes were compared against four separate sets of counts. On the basis of this review, adjusted volumes were adopted for some movements in the AM peak, such that it was considered to adequately represent typical volumes within the area.

A summary of the volumes reviewed is provided in Table 4-3. In determining volumes, consideration was given to the average of the five counts, as well as reviewing balancing through the corridor and making sense in the context of adjacent intersections. Variance in data points was also considered when determining an appropriate volume, particularly where data

points were notably higher or lower than the average (e.g.. 50 percent or more). The volume adjustments are provided in Appendix C. The historical traffic data is provided in Appendix D.

Subsequently, the adopted baseline existing peak hour traffic volumes are illustrated in Figure 4-6. A base year of 2019 was adopted, consistent with the date of the above traffic counts and the 2150 Lake Shore Boulevard West traffic study and noting that 2020 and 2021 have been pandemic-affected.

Table 4-3: Review of Historical Traffic Counts and Resultant Adopted Volumes – AM Peak

Intersection	Movement	June 2019 Count	Historical Count 1 [1]	Historical Count 2 [2]	Historical Count 3 [3]	Historical Count 4 [4]	Adopted
Park Lawn Rd / The Queensway	EBT	1320	1153	1012	1322	1054	**1120**

	SBL	861	288	682	616	573	**560**
Lake Shore Blvd W / Brookers Ln / Gardiner EB On Ramp / Gardiner WB Off Ramp	EBL	700	249	106	366	267	**300**
	SBR	393	343	276	380	226	**295**

Notes:

[1] - Count 1 – October 2016 for Park Lawn Road / The Queenway, June 2016 for Park Lawn / Gardiner On Ramp, Park Lawn / Gardiner Off Ramp and Park Lawn / Lake Shore, and January 2018 for Lake Shore / Gardiner Ramps.

[2] - Count 2 – June 2016 for all intersections.

[3] - Count 3 – November 2013 for Park Lawn Road / The Queenway, December 2014 for Park Lawn / Gardiner On Ramp, Park Lawn / Gardiner Off Ramp and Park Lawn / Lake Shore, and June 2016 for Lake Shore / Gardiner Ramps.

[4] - Count 4 – August 2011 for Park Lawn Road / The Queenway, November 2013 for Park Lawn / Gardiner On Ramp, September 2013 for Park Lawn / Gardiner Off Ramp, April 2012 for Park Lawn / Lake Shore, and December 2014 for Lake Shore / Gardiner Ramps.

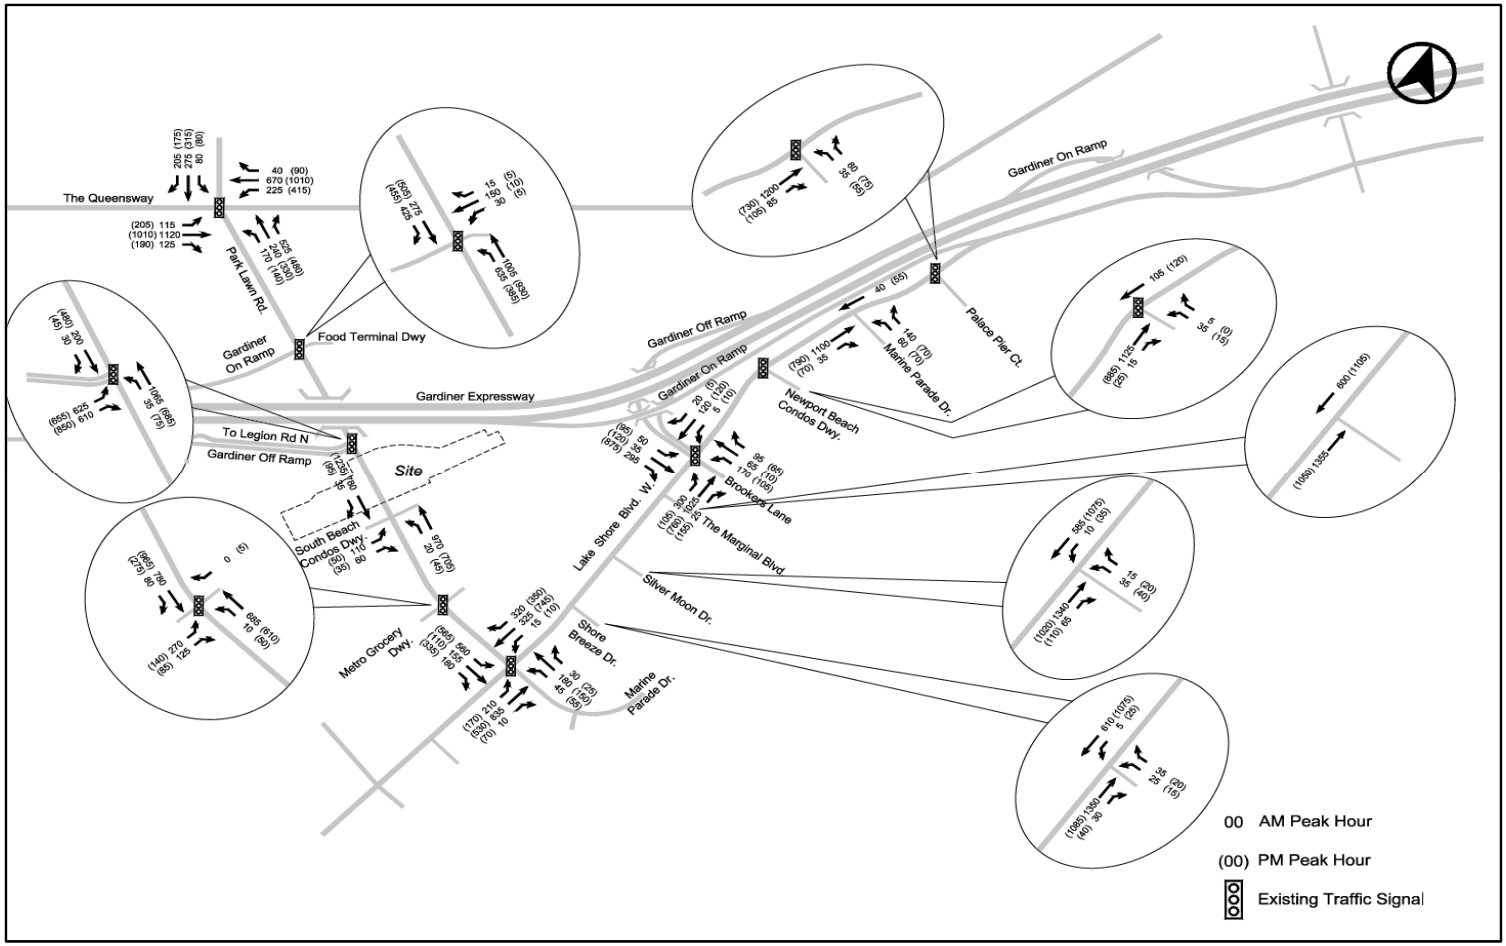

Figure 4-6: Existing (2019) Traffic Volumes

4.4.3 Existing Traffic Operations Analysis

4.4.3.1 Methodology and Model Assumptions

Signalized Intersections

Signalized intersection traffic operations analyses have been undertaken using the Synchro (version 9.0) capacity analysis software.

Analyses have been undertaken in accordance with the methodologies outlined in the Highway Capacity Manual (HCM), which provides a 'level of service' (LOS) indicator for each turning movement / approach at the intersection. The LOS provides a measure of the average delay that a motorist may experience when travelling through the intersection and ranges from "LOS A" (little delay) to "LOS F" (extended delay).

A complementary measurement also provided is a 'volume-to-capacity' ratio (v/c) for each movement, which provides a relative measure of the demand volume to capacity available to process the demand. A v/c ratio of 1.0 reflects 'at-capacity' conditions. The HCM methodology also provides an indication of the extent of any queuing on a particular movement or approach.

Unsignalized Intersections

Unsignalized intersection traffic operations analyses have also been undertaken using the Synchro (version 9.0) capacity analysis software.

Analyses have been undertaken in accordance with the methodologies outlined in the HCM. The HCM methodology provides a LOS designation for turning movements of an intersection. The LOS designation ranges from LOS A to LOS F which provides an understanding of the relative time a motorist may have to wait, on average, to complete a turn at an unsignalized intersection or driveway. LOS A designation is reflective of a condition where motorists may experience little delay, while LOS F designation is reflective of extended delays.

4.4.3.2 Network Wide Parameters

Signal Timings

Existing signal timings, phasing plans, and cycle lengths were obtained from the City of Toronto, and are provided in Appendix E.

Existing Conditions analyses at the area signalized intersections were generally undertaken using the existing signal timing plans. The exception to this is at the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection, where a study of the actual timings indicated that more time was allocated to the eastbound movements than indicated in the signal timing plan for that intersection during the PM peak. On this basis, a split of 42 seconds was adopted for the eastbound movement during the PM peak to represent the increased time that was required to accommodate the eastbound volumes as counted. The study is attached in Appendix F.

Heavy Vehicle Assumptions

Heavy vehicle percentages incorporated into the analysis were based upon information obtained from the existing intersection turning movement counts.

Bicycle Conflicts and Crossing Pedestrians

Peak hour conflicting bicycle volumes and pedestrian volumes utilized in the Existing Conditions analysis were based upon information obtained from the existing intersection turning movement counts.

Lost Time Adjustments

The City of Toronto Synchro 9 guidelines specify a base lost time adjustment factor of -1.0 seconds (e.g., a total lost time per phase equal to the amber plus all-red time minus 1 second). This was adopted in the analysis as the default value.

In some instances, alternate lost time adjustment factors were adopted where existing intersection operations as reported by Synchro were calibrated to more accurately reflect actual existing operating conditions. Further details of adopted calibrations are provided in Section 4.4.3.3.

Peak Hour Factor

The City of Toronto Synchro 9 guidelines specify that where available, peak hour factors should be calculated from existing traffic count information.

As such, for the Existing Conditions analysis, the peak hour factors were calculated based on the obtained traffic data.

4.4.3.3 Model Calibration

Calibrations were undertaken at some intersections as required, such that Existing Conditions as reported by Synchro more accurately reflected actual operating conditions and v/c ratios on turning movements under Existing Conditions were equal to no more than 1.0.

The calibrations undertaken are summarized in Table 4-4, whilst calibration studies are attached in Appendix F.

Table 4-4: Summary of Model Calibrations

Intersection	Calibration	AM Peak	PM Peak
Lake Shore Blvd W / Marine Parade Dr	NBLR Control Delay[1]	32	25
Lake Shore Blvd W / Shore Breeze Dr	NBLR Control Delay[1]	30	37
Lake Shore Blvd W / Silver Moon Dr	NBLR Control Delay[1]	46	38
Park Lawn Rd / Gardiner EB Off Ramp / Legion Rd	EBR right turn on red saturation flow[2]	-	633

Intersection	Calibration	AM Peak	PM Peak
Park Lawn Rd / Gardiner Westbound On Ramp / Ontario Food Terminal	NBL Lost Time Adjust[3]	-4	-
Park Lawn Rd / The Queensway	WBL Lost Time Adjust[3]	-2	-2

Notes:
1. Control delay calibrations made via critical and follow up gap adjustments, based on delay studies (attached in Appendix F).
2. Calibration made based on right turn on red study (attached in Appendix F) and right turn on red saturation flow rate equation detailed on page 8-11 of the Synchro Studio 9 User Guide.
3. Calibration made based on result of intergreen study (attached in Appendix F).

4.4.3.4 Traffic Operations Analysis Results

The traffic operations analysis results for Existing Conditions are shown graphically in Figure 4-7 and are summarized in Table 4-5 and

Table 4-6 for signalized and unsignalized intersections respectively. For signalized intersections, movements approaching capacity with a V/C value over 0.90 and for unsignalized intersections, movements with a LOS F have been highlighted orange. The existing traffic operations Synchro reports are provided in Appendix G.

Whilst the area road network is currently operating within theoretical capacity, there are a number of intersections/movements which are in high demand, including:

- The Park Lawn Road / The Queensway intersection is approaching capacity under all analysis periods;
- High demand for the northbound left turn movement at the Park Lawn Road / Gardiner Expressway Westbound On Ramp / Ontario Food Terminal intersection, primarily during the AM peak hour;
- High demand for movements off the Gardiner Expressway at the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection, particularly during the PM peak hour;
- High demands at the Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive intersection;
- High demand for movements off the Gardiner Expressway at the Lake Shore Boulevard West / Gardiner Eastbound On Ramp / Gardiner Westbound Off Ramp / Brookers Lane intersection, particularly during the PM peak hours;
- Eastbound movements along the Lake Shore Boulevard West corridor are approaching capacity in the single lane section to the east of the Site, primarily during the AM peak hour; and
- Movements out of the side roads at unsignalized intersections to Park Lawn Road and Lake Shore Boulevard West have extended delays.

5. Near Term Horizon Conditions

5.1 Planned and Committed Area Development

The planned and committed area development assumed for the purpose of the near term horizon conditions are summarized in Table 5-1. Overall, the background sites represent development in the order of 9,300 residential units and 123,000 square metres of non-residential uses.

Table 5-1: Area Background Development

Development	Statistics
2150 Lake Shore Blvd W – Phase 1	1,245 Residential Units 5,364 m^2 Retail 23,682 m^2 Office
42 Park Lawn Road	321 Residential Units
2313 Lake Shore Blvd	241 Residential Units
Humber Bay Shores[1]	5,272 Residential Units 23,517 m^2 Commercial / Retail
Mimico-Judson	1,686 Residential Units 70,130 m^2 Office
251 Manitoba St	498 Residential Units
Total	**9,300 Residential Units** **123,000 m^2 Non-Residential**

Notes: 1. Development is partially constructed and occupied (estimated 2,141 units) at the time of the existing traffic counts.

5.2 Committed Area Transportation Network Changes

5.2.1 Street Network Changes

A number of street network changes and enhancements in the vicinity of the planned Park Lawn GO Station are considered within the ongoing Christie's Secondary Planning Study and Park Lawn Lake Shore TMP, as well as other area development studies.

Changes associated with the Park Lawn Lake Shore TMP are included in the City's public meeting materials, most recently held on July 26 and August 9, 2021. Noted changes associated with the 2150 Lake Shore development are outlined in the Urban Transportation Considerations report prepared by BA Group (dated September, 2019), whilst noted changes associated with the Humber Bay Shores background development are outlined in the Updated Traffic Impact Study prepared by MMM Group and AECOM (dated August, 2014).

It is noted that whilst a large suite of street network improvements are proposed as part of the full build-out of the 2150 Lake Shore site and as part of the Park Lawn Lake Shore TMP, not all of these will be completed within the Near Term Horizon (2028).

Accordingly, an overview of the assumed road-related changes for the Near Term Horizon (2028) are outlined in the following sections. The Near Term Horizon (2028) road network is shown graphically in Figure 5-1, whilst future lane configurations and traffic control are shown in Figure 5-2.

5.2.1.1 Public Street A

As part of the 2150 Lake Shore development and included in the Park Lawn Lake Shore TMP, the construction of Public Street A is proposed, which is a new east-west road link proposed to extend from the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road intersection to the Lake Shore Boulevard West / The Marginal Boulevard intersection, primarily through the 2150 Lake Shore site. Public Street A is proposed to be constructed with Phase 1 of the 2150 Lake Shore development and will therefore be in place for the Near Term Horizon (2028).

In the west end, Public Street A will form a new fourth approach to the existing Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road signalized intersection, with associated lane configuration changes. At the east end, Public Street A will form a new fourth approach to the existing Lake Shore Boulevard West / The Marginal Boulevard intersection, with the intersection proposed to be signalized and associated lane configurations changes as proposed by the 2150 Lake Shore development. A new traffic signal is also proposed mid-way along Public Street A just east of the rail corridor, providing access to the 2150 Lake Shore site.

Public Street A will provide four lanes (two lanes in each direction). In the eastbound direction, a curbside layby will be provided for accessible PUDO (paratransit/TTC WheelTrans facilities).

5.2.1.2 2150 Lake Shore Internal Network

In addition to the aforementioned Public Street A, the 2150 Lake Shore development includes a number of other proposed roads, forming the development's internal road network.

Ultimately, in addition to Public Street A, the development's internal road network will comprise:

- Public Street B (Loop Road) (connecting to Lake Shore Boulevard West at Shore Breeze Drive and Silver Moon Drive at each end) and looping through the development; and
- East-west roads connecting Park Lawn Road to Public Street B (Loop Road) (Public Street C) and Public Street A to Public Street B (Loop Road) (Private Street D).

However, for Phase 1 of the development, aligning with the Near Term Horizon (2028), only part of the internal road network is proposed to be constructed as follows:

- Construction of Public Street C, extending east-west between Park Lawn Road and Public Street B (Loop Road). Public Street C will form a fourth approach at the existing Park Lawn Road / Metro Grocery Driveway signalized intersection.

- Partial construction of Public Street B (Loop Road), extending towards the Station from Public Street C and terminating in a cul-de-sac. Public Street B (Loop Road) will not connect to Lake Shore Boulevard West in the Near Term Horizon (2028).

5.2.1.3 Park Lawn Road Improvements

As part of the 2150 Lake Shore development, Park Lawn Road is proposed to be widened in the order of 6 to 8 metres to fulfil the preferred width as designated in the City of Toronto Official Plan. It is assumed that in the Near Term Horizon (2028), the section of Park Lawn Road between the aforementioned Public Street A and Public Street C will be widened.

5.2.1.4 Legion Road Extension

An extension to Legion Road from its current southern limit near the Gardiner Expressway eastbound off ramp to Park Lawn Road, to its current northern limit near Lake Shore Boulevard West, is currently being considered by the City of Toronto. It is assumed that this improvement will be in place for the Near Term Horizon (2028).

5.2.1.5 General Intersection Improvements

Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road / Public Street A

In addition to the modifications necessary at this intersection to incorporate the addition of Public Street A, the 2150 Lake Shore development proposes the removal of the eastbound right turn slip lane. This improvement is assumed to be incorporated with the construction of Public Street A and would therefore be in place for the Near Term Horizon (2028).

Park Lawn Road / The Queensway

As part of the 2150 Lake Shore development, modifications are proposed to this intersection to incorporate an eastbound right turn lane and increase the capacity of this movement. This improvement is considered necessary to accommodate projected Near Term Horizon (2028) background development traffic and is therefore assumed to be in place.

Park Lawn Road / South Beach Condos Driveway / 2150 Lake Shore Boulevard West Driveway

A new traffic signal is proposed at the existing Park Lawn Road / South Beach Condos driveway intersection, with a driveway to the 2150 Lake Shore development forming a new fourth approach. This improvement is proposed to be constructed with Phase 1 of the 2150 Lake Shore site and will therefore be in place for the Near Term Horizon (2028).

Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive

The split phasing is assumed to be removed, with the existing northbound combined left/through lane converted to a northbound left turn lane only. Other changes along Lake Shore Boulevard West are expected to occur after the Near Term (2028) timeframe.

Lake Shore Boulevard West / Silver Moon Drive

In the Near Term Horizon (2028), prior to the full construction of Public Street 'B' (Loop Road) proposed as part of the 2150 Lake Shore development, the Lake Shore Boulevard West / Silver Moon Drive intersection is assumed to be signalized with associated lane changes, proposed as part of the Humber Bay Shores development. Other changes along Lake Shore Boulevard West are expected to occur after the Near Term (2028) timeframe.

Lake Shore Boulevard West / Shore Breeze Drive

In the Near Term Horizon (2028), prior to the full construction of Public Street 'B' (Loop Road) proposed as part of the 2150 Lake Shore development, the Lake Shore Boulevard West / Shore Breeze Drive intersection is assumed to be subject to right in/right out restrictions, proposed as part of the Humber Bay Shores development. Other changes along Lake Shore Boulevard West are expected to occur after the Near Term (2028) timeframe.

5.2.2 Assumed Near Term Horizon (2028) Road Network

Based on the abovementioned area transportation network changes, this section provides an overview of the assumed road network, lane configurations and traffic control for the purpose of the Near Term Horizon analysis.

Base Analysis

The assumptions for the base analysis are outlined below:

- Prior to the full construction of Public Street B (Loop Road) proposed as part of the 2150 Lake Shore development, traffic control and lane configurations along Lake Shore Boulevard West at Silver Moon Drive and Shore Breeze Drive are assumed to be as proposed for the Humber Bay Shores background development as follows:
    - Signalization of the Lake Shore Boulevard West / Silver Moon Drive intersection and associated lane configuration changes; and
    - Right in/right out only turn restrictions for Shore Breeze Drive at Lake Shore Boulevard West and associated lane configuration changes.
- Construction of Public Street A proposed as part of the 2150 Lake Shore development has been completed;
- Partial construction of the internal road network proposed as part of the 2150 Lake Shore development, connecting to Park Lawn Road at its intersection with the existing Metro Grocery driveway (with associated lane configuration changes) and ending within the 2150 Lake Shore site as a cul-de-sac to the southeast of the Station;
- Driveways from external roads to Phase 1 of the 2150 Lake Shore Boulevard development as follows:

- Driveway to Park Lawn Road at its intersection with the existing South Beach Condos driveway (to be signalized and with associated lane configuration changes); and
- Driveway to Public Street A (to be signalized and with associated lane configurations).

- Adjustments to lane configurations at the following intersections:
  - Park Lawn Road / The Queensway;
  - Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road / Public Street A; and
  - Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive
  - Lake Shore Boulevard West / Public Street A / The Marginal Boulevard.

5.2.3 Transit Network Changes

Significant transit investment is planned for the GO Station and neighbourhood area, as supported in City and Regional transportation plans and proposed as part of the 2150 Lake Shore development which are expected to redefine transit access to / from the west end of Toronto, and more specifically, the Humber Bay Shores neighbourhood.

As per the street network changes, not all of the transit improvements proposed as part of the Park Lawn Lake Shore TMP and the full build-out of the 2150 Lake Shore site will be completed within the Near Term Horizon (2028)..

Accordingly, an overview of the assumed transit-related changes for the Near Term Horizon (2028) are outlined in the following sections. The Near Term Horizon (2028) transit network is shown graphically in Figure 5-3.

5.2.3.1 Park Lawn GO Station

The Park Lawn GO Station as outlined in this report will serve as a major terminus or transfer point for residents, commuters, and visitors of the area.

Two-way, all-day GO rail service is being contemplated, which will greatly improve commuter rail travel options along the Lakeshore West GO corridor. Travel times to downtown Toronto will be less than 15 minutes, which will make public transit highly attractive to those travelling to / from the neighbourhood.

5.2.3.2 Mobility Hub

As part of the 2150 Lake Shore development, a mobility hub is proposed, intended to facilitate connection between the GO Train, TTC streetcar and TTC bus services. Ultimately, the mobility hub will include upgraded bus stops along Park Lawn Road adjacent the Station. The mobility hub will also include new streetcar stops within the 2150 Lake Shore site adjacent to the Station, accessed via new streetcar tracks aligned along Public Street ‘B’ (Loop Road).

However, for Phase 1 of the development, aligning with the Near Term Horizon (2028), the mobility hub will not be fully constructed. For this timeframe, it is expected that the construction of the upgraded bus stops along Park Lawn Road adjacent the Station and Public Street 'C' will be completed, facilitating connection between GO Train services and TTC bus services. The streetcar component of the mobility hub relies on the construction of Public Street 'B' (Loop Road), which is not proposed to be completed until after Phase 1 of the 2150 Lake Shore development.

5.2.3.3 TTC Route Adjustments

As part of the construction of the mobility hub, the 2150 Lake Shore development proposes for an additional bus service (80 Queensway) to reroute to the Site area. This route adjustment is assumed to be in place for the Near Term Horizon (2028).

5.2.4 Active Transportation Network Changes

Changes to the active transportation network, as supported in City and Regional transportation plans and proposed as part of the 2150 Lake Shore development will improve pedestrian and cycling access and comfort through the Site area.

As per the street and transit network changes, not all of the active transportation improvements proposed as part of the full build-out of the 2150 Lake Shore site will be completed within the Near Term Horizon (2028), with only Phase 1 of the development proposed to be constructed within this timeframe.

Accordingly, an overview of the assumed active transportation-related changes for the Near Term Horizon (2028) are outlined in the following sections. The Near Term Horizon (2028) pedestrian and cycling networks are shown graphically in Figure 5-4 and Figure 5-5 respectively.

5.2.4.1 Pedestrian Infrastructure

A number of new pedestrian facilities and improvements to existing pedestrian facilities are proposed as part of the 2150 Lake Shore site, including the following assumed to be in place for the Near Term Horizon (2028):

- A three metre sidewalk along the south side of Public Street A, including a direct connection to the Station;
- Improvements to the existing sidewalks along the east side of Park Lawn Road between Public Street C and Public Street A, with the wider Park Lawn Road boulevard allowing the implementation of landscaping providing a buffer between the sidewalk and traffic lanes;
- New sidewalks along Public Street C and the partially constructed Public Street B (Loop Road) within the 2150 Lake Shore site;
- The proposed Station Square, providing a key connection to the Station from Public Street B (Loop Road);

- A new pedestrian plaza connecting between Park Lawn Road and Public Street B (Loop Road) and ultimately to the Station via the abovementioned Station Square. The pedestrian plaza is located between the existing Metro Grocery driveway and the existing South Beach Condos driveway; and
- New signalized crossing opportunities along Park Lawn Road, Lake Shore Boulevard West and Public Street A.

5.2.4.2 Bicycle Infrastructure

A number of new cycling facilities are proposed as part of the 2150 Lake Shore site and the Park Lawn Lake Shore TMP, including the following assumed to be in place for the Near Term Horizon (2028):

- A two-way cycle track along the east side of Park Lawn Road between Public Street C and Public Street A and a temporary two-way cycle track along the east side of Park Lawn Road between Public Street C and Lake Shore Boulevard West, providing direct access to the Station bicycle parking. It is noted that the temporary section will be connected to the surrounding bicycle infrastructure and is proposed to remain in place until this section of Park Lawn Road is reconstructed fully;
- A two-way cycle track along the partially constructed Public Street B (Loop Road) within the 2150 Lake Shore site;
- A cycling facility as part of the Legion Road extension; and
- Bicycles will also be able to utilize the aforementioned Station Square to access the Station.

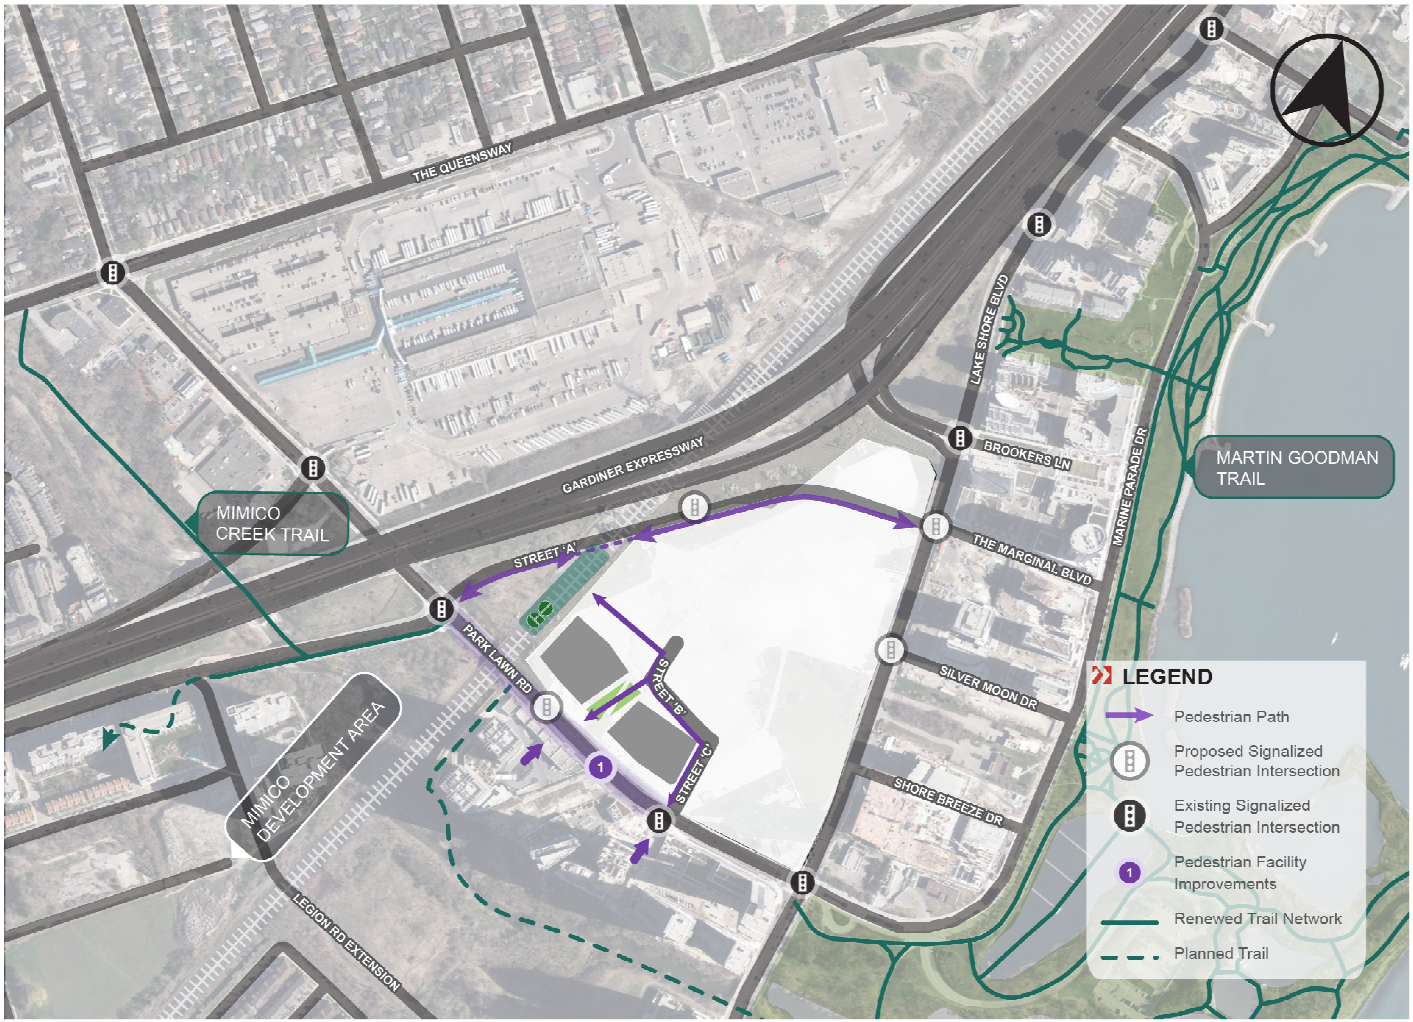

Figure 5-4: Near Term Horizon (2028) Pedestrian Network

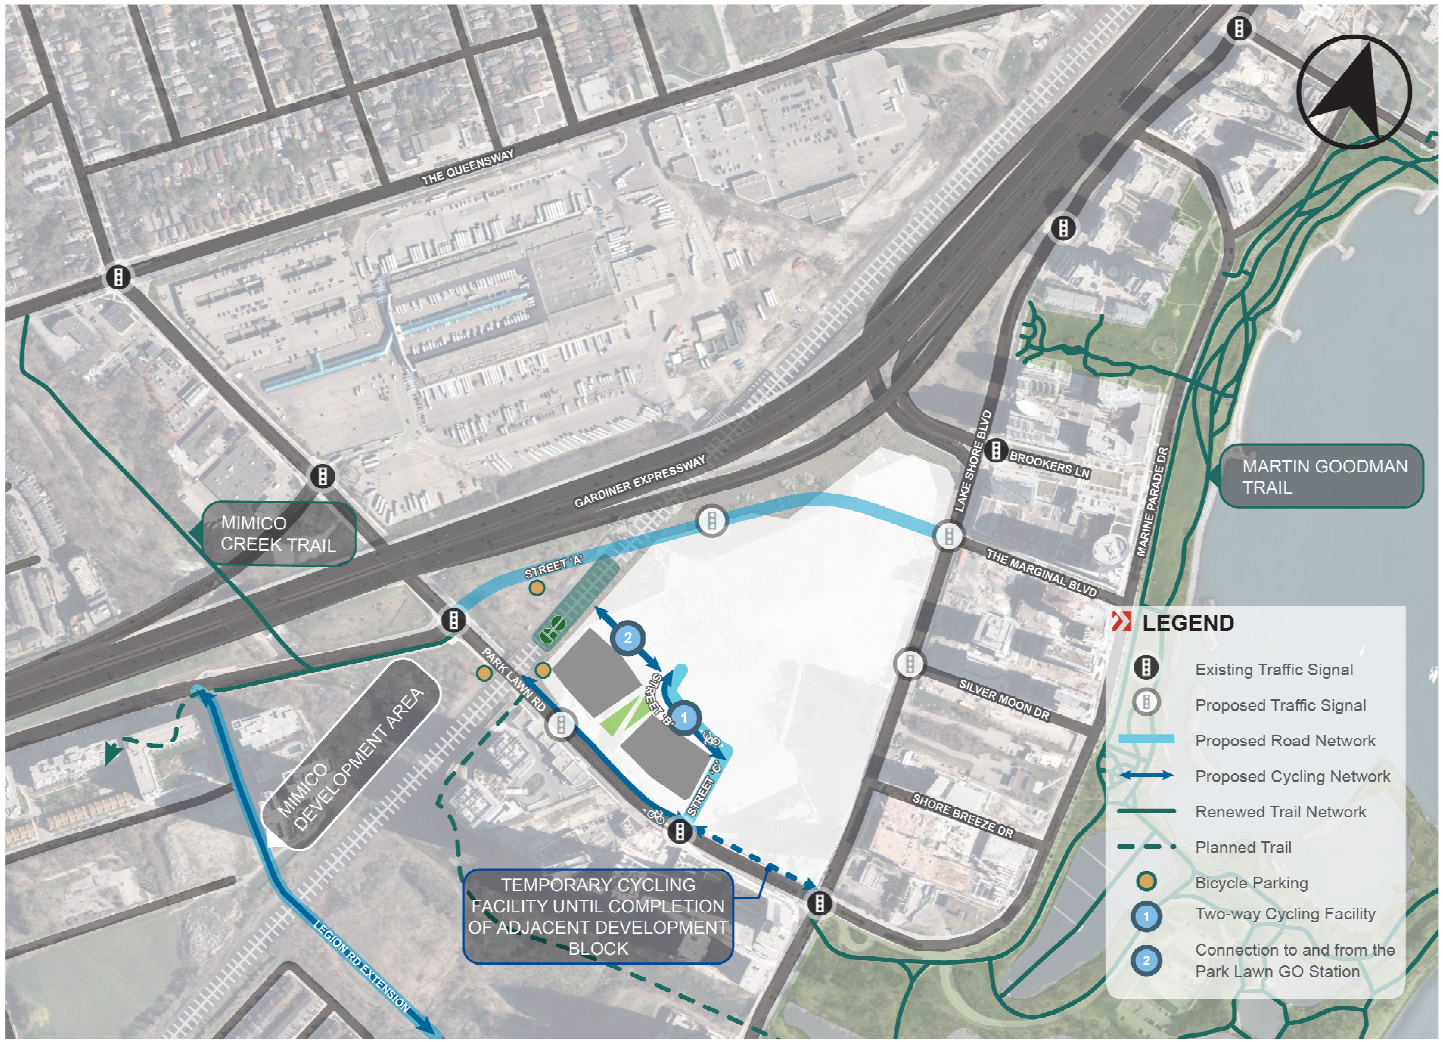

Figure 5-5: Near Term Horizon (2028) Bicycle Network

5.3 Background Traffic Conditions

5.3.1 Area Traffic Changes due to New Roads (Diversion)

As a result of the new road infrastructure outlined above, vehicle travel patterns through the Study Area are expected to change. Most notably, the following changes to travel patterns are expected:

- The construction of Public Street A will provide an alternate route between Park Lawn Road, north of the Site and Lake Shore Boulevard West, east of the Site, and is expected to result in some diversions which will alleviate Park Lawn Road and Lake Shore Boulevard West;
- The Legion Road extension proposed by the City of Toronto will provide an alternate route between the Gardiner Expressway Eastbound Off Ramp/Park Lawn Road, north of the Site and Lake Shore Boulevard West, west of the Site. This is also expected to result in some diversions which will further alleviate Park Lawn Road and Lake Shore Boulevard West; and
- Existing vehicle movements at locations where future turn restrictions are proposed will need to be diverted to alternate locations.

The overall area traffic changes due to the new roads are illustrated in Figure 5-6, whilst individual figures for each key piece of infrastructure discussed above are provided in Appendix C.

5.3.2 Background Development Traffic Volumes

5.3.2.1 Background Development Vehicle Trip Generation

Details of the forecasting for the background developments are outlined in Appendix H. The forecasting prepared is consistent with the methodology and assumptions adopted in the Urban Transportation Considerations report prepared by BA Group for the 2150 Lake Shore development (dated September, 2019). A summary of the resulting projected vehicle trip generation of the background developments is provided in Table 5-2.

Table 5-2: Background Development Vehicle Trip Generation

Methodology	AM Peak			PM Peak		
	Inbound	Outbound	Two Way	Inbound	Outbound	Two Way
2150 Lake Shore *(1,245 units, 23, 682 m^2 office, 5,364 m^2 retail)*	125	145	270	130	160	290
42 Park Lawn *(321 units)*	5	25	30	25	10	35
2313 Lake Shore *(241 units)*	10	45	55	35	15	50
Humber Bay Shores *(3,131 units)*[1]	80	340	420	235	105	340
Mimico-Judson *(1,686 units, 70,130 m^2 office)*	305	335	640	260	325	585
251 Manitoba *(498 units)*	35	95	130	80	40	120

Notes: 1. Development is partially constructed and occupied (estimated 3,131 units of 5,272 total remain to be constructed).

5.3.2.2 Background Development Traffic Distribution

The projected distribution and associated mode split of residential, office and retail trips are outlined in the abovementioned Appendix H. On the basis of this information, a direction of approach for vehicles has been determined for each of these land uses.

With respect to the retail, trips outside of those generated from within the Local distribution zone are expected to remain relatively local in nature, generally within an approximate 5 minute drive of the 2150 Lake Shore development. In this respect, external retail trips are expected to generally originate from the Mimico neighbourhood to the west, the Queensway neighbourhood to the north and the Swansea neighbourhood to the northeast. A direction of approach for vehicles has therefore been determined on the basis of these catchment areas and their respective populations.

The adopted distributions are consistent with the methodology and assumptions adopted in the abovementioned Urban Transportation Considerations report prepared by BA Group for the 2150 Lake Shore development.

The adopted Site traffic distributions are summarized in Table 5-3.

5.3.2.3 Background Development Traffic Volume Assignment

The resultant background development traffic volumes are illustrated in Figure 5-7

Table 5-3: Background Development Traffic Distribution

Route	Direction	Residential	Office	Retail
The Queensway	East	10%	10%	20%
	West	5%	5%	15%
Park Lawn Road	North	0%	5%	15%
Gardiner Expressway	East	30%	65%	0%
	West	45%	10%	0%
Lake Shore Boulevard West	East	5%	0%	10%
	West	5%	5%	40%
Total		**100%**	**100%**	**100%**

5.3.3 Corridor Growth Traffic Volumes

No specific allowance has been made for general (non-development) corridor growth, assuming that the majority of traffic growth in the area will be associated with the proposed developments in the area, and is already allowed for in the calculation of background development traffic.

5.3.4 Future Background Traffic Volumes

The resultant future background traffic volumes are illustrated in Figure 5-8.

It is noted that the development of the 2150 Lake Shore site does not occur without the construction of the GO Station. Furthermore, the GO Station is highly supportive of alternative transportation modes and subsequently reduces the projected volume associated with the outlined background developments.

In this respect, the Future Background scenario is theoretical in nature. It has been assumed for the purpose of this scenario, that the GO Station is in place to provide transit-related benefits, but without the projected traffic generation of the Station. This allows a discrete comparison to be made to isolate the impact of the GO Station, which is relatively small.

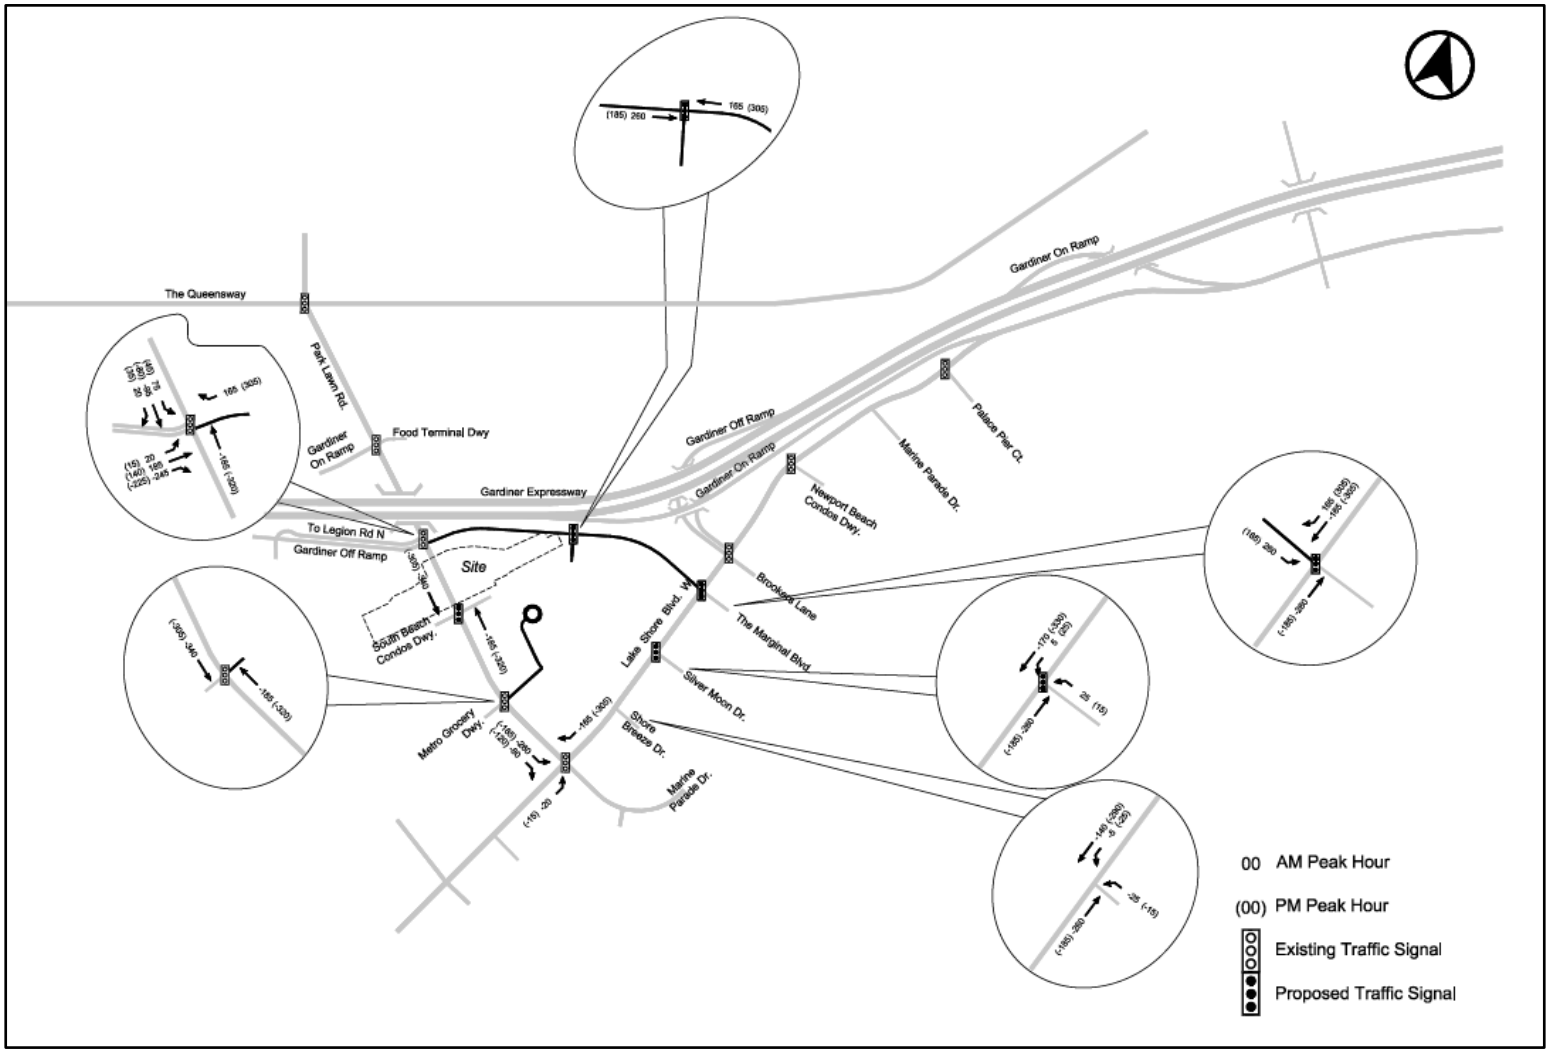

Figure 5-6: Near Term Horizon (2028) – Future Area Network Changes Due to New Roads (Diversion)

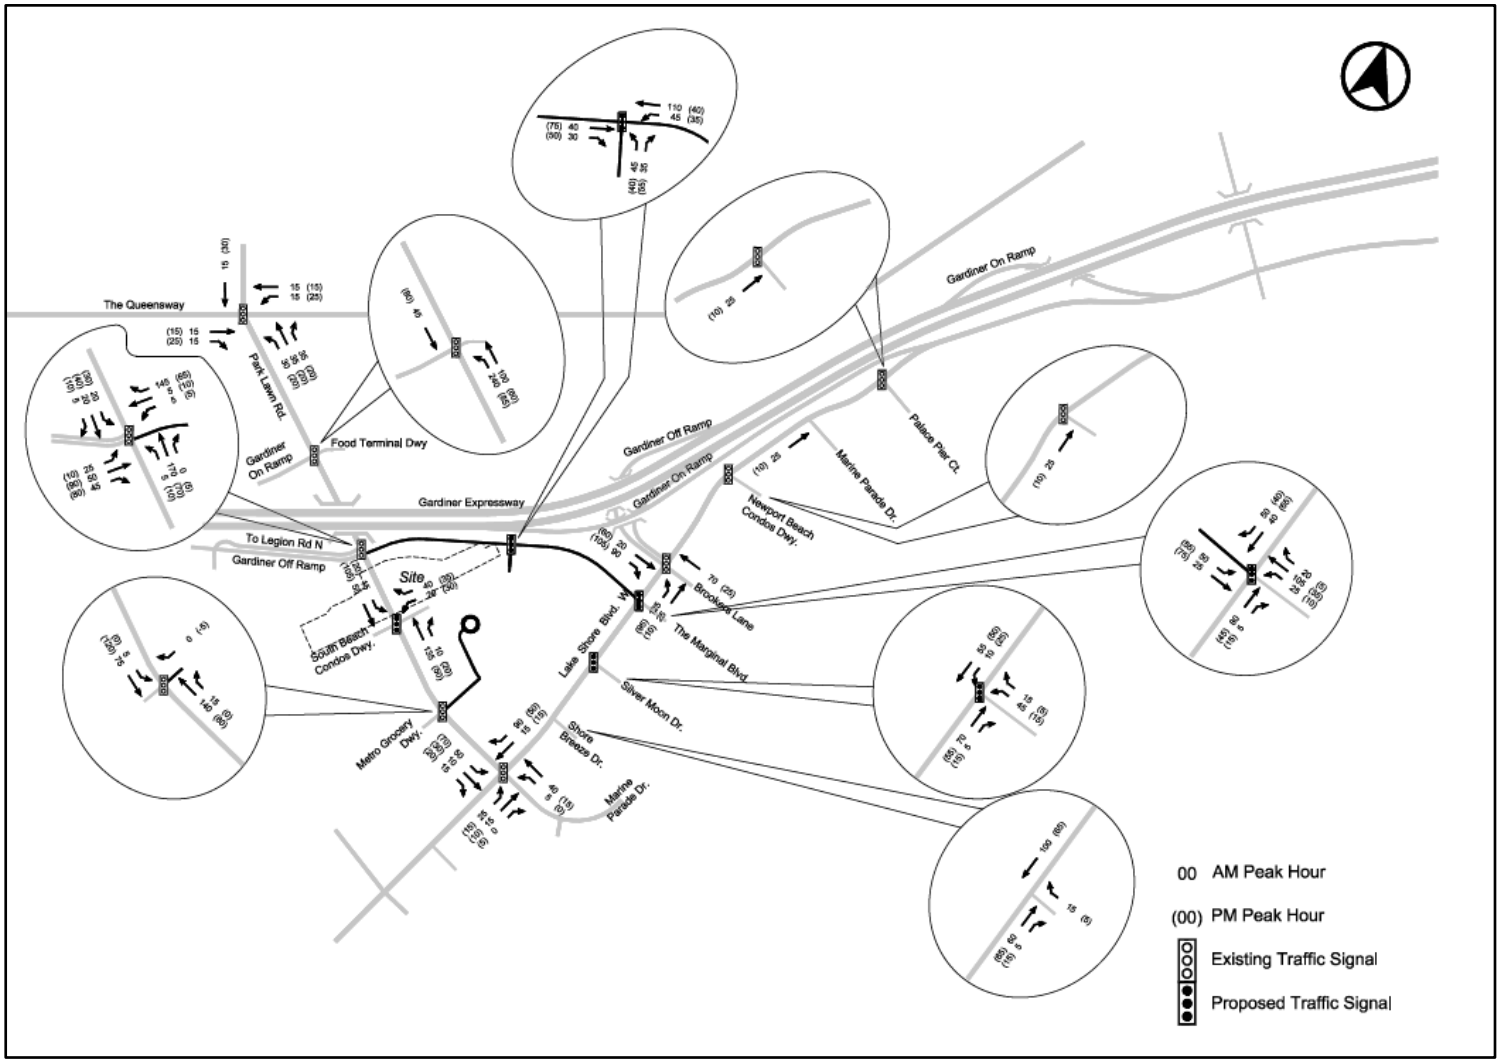

Figure 5-7: Near Term Horizon (2028) – Background Development Traffic Volumes

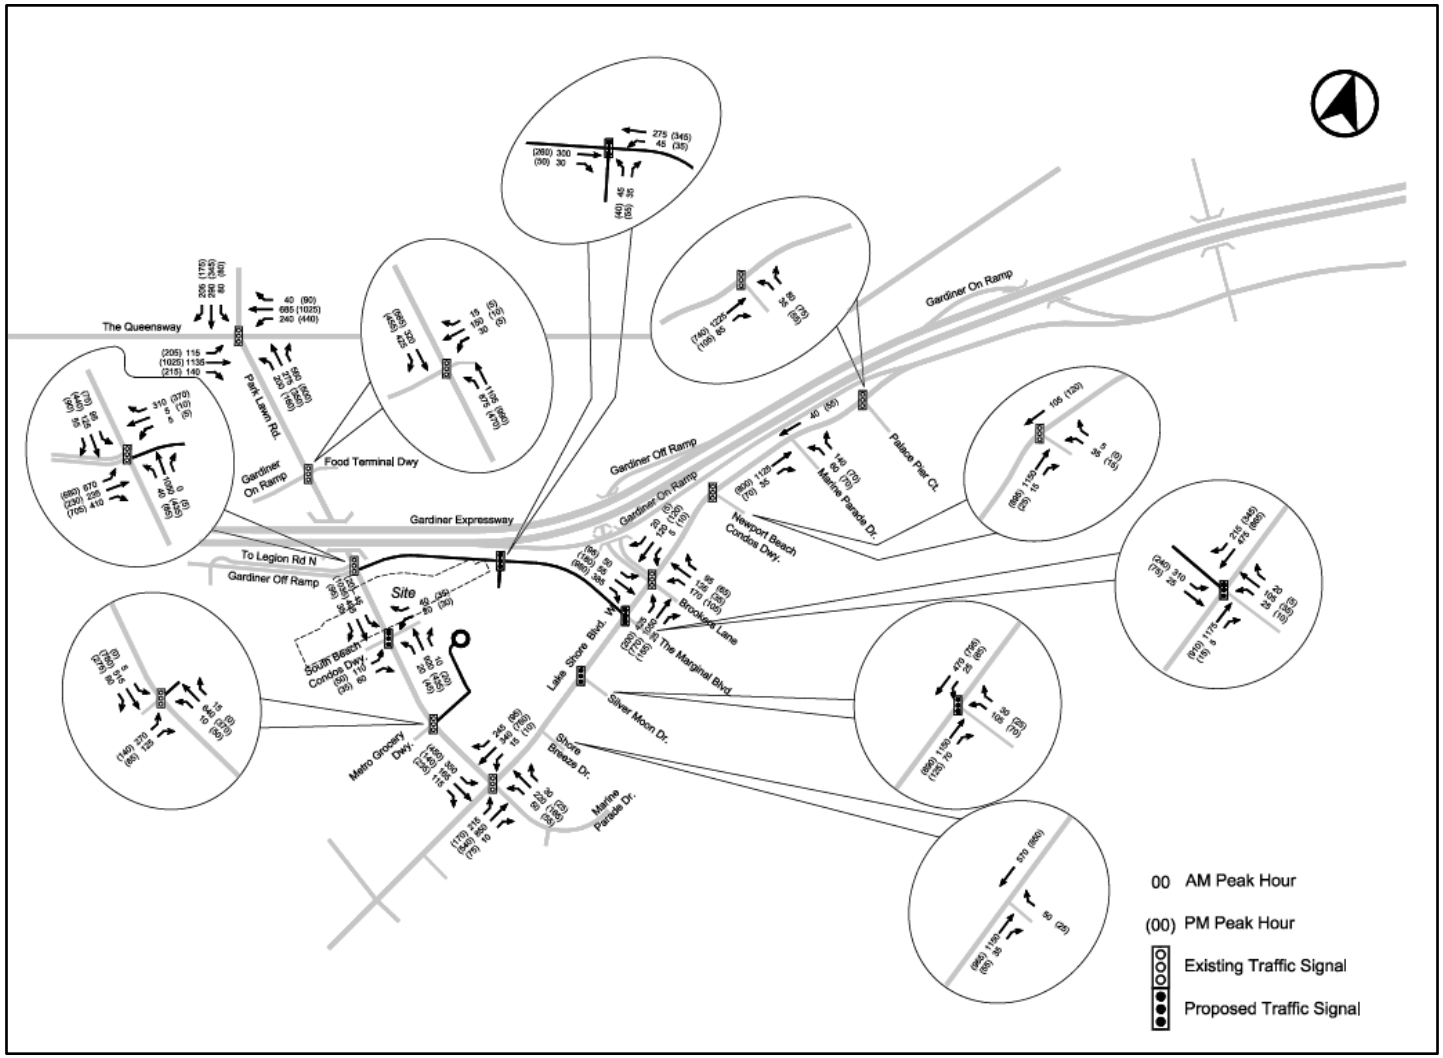

Figure 5-8: Near Term Horizon (2028) – Future Background Traffic Volumes

5.3.5 Future Background Traffic Operations Analysis

5.3.5.1 Methodology and Assumptions

The methodology, model assumptions, network wide parameters and model calibrations remain generally consistent with those outlined in Section 4.4.3 for the Existing Conditions analysis. The exceptions to the above are as follows:

- Signal timing changes have been made where appropriate to accommodate future traffic volumes. These changes are outlined in further detail in Section 5.3.5.2;
- Conflicting pedestrian volumes were increased to account for expected greater pedestrian activity in the area; and
- For new intersections under future conditions, default peak hour factors were adopted as outlined in the City of Toronto Synchro 9 guidelines, as follows:
    - Peak hour factor of 0.90 during the AM peak hour;
    - Peak hour factor of 0.90 for left turn movements during the PM peak hour; and
    - Peak hour factor of 0.95 for all other movements during the PM peak hour.

5.3.5.2 Signal Timing Changes

Optimized traffic signal timings were adopted in the analyses of future traffic scenarios, where required, to best accommodate future traffic demands and patterns. Note that existing cycle lengths and pedestrian minimum times were generally maintained in all scenarios, with the exception of the following changes which were proposed as part of the 2150 Lake Shore development (as outlined in the Urban Transportation Considerations report prepared by BA Group, dated September, 2019) and adopted for the purpose of this analysis:

- The cycle length at the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road / Public Street A intersection was increased to 144 seconds during the AM and PM peak hours under future conditions (from 104 seconds in the AM peak hour and 88 seconds in the PM peak hour), to allow the additional time required to accommodate the addition of Public Street A and to allow additional time for the eastbound left turn movement. The above cycle lengths are consistent with the Park Lawn Road / The Queensway intersection to the north;
- The cycle length at the Park Lawn Road / Gardiner Expressway Westbound On Ramp / Ontario Food Terminal intersection was also increased to 144 seconds during the AM and PM peak hours under future conditions (from 104 seconds in the AM peak and 88 seconds in the PM peak hour), consistent with the above and to allow additional time for the northbound left turn movement.; and
- The minimum walk time at the Park Lawn Road / Gardiner Expressway Eastbound Off Ramp / Legion Road / Public Street A intersection was reduced to 7 seconds under Future Total conditions to allow additional time to be allocated to the east-west

movements. The flash don't walk time was maintained to ensure sufficient crossing time for pedestrians.

For the proposed new signalized intersections along Park Lawn Road, Lake Shore Boulevard West and Public Street A, a cycle length of 140 seconds was adopted, consistent with the Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive intersection.

5.3.5.3 Traffic Operations Analysis Results

The traffic operations analysis results for the Near Term Horizon (2028) future background conditions are shown graphically in Figure 5-9 and are summarized in Table 5-4 and Table 5-5 for signalized and unsignalized intersections respectively. For signalized intersections, movements approaching capacity with a V/C value over 0.90 and for unsignalized intersections, movements with a LOS F have been highlighted orange. The future background traffic operations Synchro reports are provided in Appendix G.

Overall, with the implementation of the assumed new road infrastructure and signal timing changes as outlined in Sections 5.2.2 and 5.3.5.2 respectively, the road network is projected to generally operate within theoretical capacity under future background conditions, albeit the Lake Shore Boulevard West / Brookers Lane / Gardiner Eastbound On Ramp / Gardiner Westbound Off Ramp intersection is projected to exceed theoretical capacity under these forecasts. As previously discussed, the Park Lawn Lake Shore TMP is reviewing the long term transportation needs in the area. As the context of the area continues to evolve and proposed road, transit and active transportation infrastructure comes online, mode shifts, volumes and operations can be expected to continue to adjust, as is being addressed by the Park Lawn Lake Shore TMP.

In particular, the relief along the Park Lawn Road and Lake Shore Boulevard corridors in the vicinity of the Site is notable, whilst many other area intersections are projected to operate under similar conditions to existing, subject to the outlined lane configuration and signal timing changes.

5.4 Park Lawn Go Station Activity Level Forecasts

5.4.1 Assumed GO Ridership

The assumed GO ridership at the proposed Station is based on the analysis outlined in the Updated IBC, 2020.

The IBC 2020 provided two sets of ridership projections as follows:

- **Economic Case:** Ridership projections for a 2041 horizon year, based on a 2031 horizon year service plan; and
- **Sensitivity Test:** Ridership projections for a 2041 horizon year, with an increased service sensitivity for improvements that may be made between 2031 and 2041, but are currently unfunded.

The IBC 2020 notes that the Economic Case showed some capacity constraints on Lakeshore West trains and that under the Sensitivity Test with the increased service, results indicate projected ridership significantly increases.

Whilst the Economic Case ridership projections are based on a 2041 horizon year, given it is based on a 2031 horizon year service plan and noting the capacity constraints identified as mentioned above, it is considered reasonable to adopt the ridership projections for the Economic Case for the purpose of this Near Term Horizon (2028) analysis. The IBC 2020 notes that the service concept assumes that all local trains stop at both Park Lawn and Mimico Station and that it will be supportive of 15 minute or better service.

Within each of the ridership projection sets outlined above, the IBC 2020 also provides two scenarios as follows:

- **Business as usual (BAU Fare):** Assumes the 2018 double discounted fare ($1.50) for users transferring between GO and TTC; and
- **Integrated Fare:** Assumes a full discount for riders transferring between GO to TTC, consistent with the vision of the Metrolinx 2041 Regional Transportation Plan.

Given the increased discount, the projected ridership for the Integrated Fare scenario is higher. For the purpose of a conservative analysis, the ridership projections for the Integrated Fare scenario have been adopted.

It is also noted that the IBC 2020 does not provide ridership projections for the PM peak. For the purpose of this analysis, it is assumed that the PM peak two-way ridership is consistent with the AM peak two-way ridership.

The resultant projected Station ridership is outlined in Table 5-6. As shown, a peak hour two-way ridership of 1,050 has been adopted for the purpose of the following analysis.

Table 5-6: Projected Station Ridership – Near Term Horizon (2028)

	Two Way Projected Ridership
IBC 2020 Economic Case Integrated Fare Scenario AM Peak Period (3 hr) Ridership	2,100
Assumed Percentage of Peak Period (3 hr) Ridership Occuring During Peak Hour (1 hr)	50%
Assumed Peak Hour Ridership	**1,050**

5.4.2 Mode Split

As previously discussed in this report, the proposed Station is expected to be a low generator of traffic trips, given the following:

- There is no commuter parking proposed; and
- Ridership at the GO Station is forecast to be heavily reliant upon local area walk-in and transit based trips, noting the urban “City” form being pursued to support local area transit-oriented development.

On the basis of the above, vehicle trip generation is expected to be limited to PUDO activity, with the majority of trips to/from the Station made by active transportation or transit modes.

Generally, mode splits for trips to/from the proposed Station are expected to be comparable to other existing GO Stations in similar urban contexts, such as Exhibition, Danforth and Bloor GO Stations. It is noted that other nearby stations, such as Mimico and Long Branch provide on-site parking and are much more suburban than the future context of the Site area. In light of this, mode splits at the abovementioned urban context stations are considered most appropriate and have been sourced from the 2015 GO Rail Passenger Survey and are summarized inTable 5-7.

As discussed above, Site mode splits are expected to be generally in line with these proxy stations, however it is noted that the planned multimodal hub and the local transit accessibility of the Station is expected to result in higher local transit usage to/from the Station than is currently observed in similar contexts. In this respect, a slightly higher local transit usage has been adopted. The adopted mode splits, as shown inTable 5-7, are consistent with those adopted in the Urban Transportation Considerations report prepared by BA Group (dated September, 2019) for the 2150 Lake Shore development.

Consistent with the proxy Sites, no auto driver mode split is projected, noting that there is no commuter parking proposed and the substantial population and potential ridership within the immediate proximity of the Site. Other parking lots in the area (e.g., West Lake Development, Humber Bay Shores, 2150 Lake Shore) are private and not for the purpose of commuter parking, and utilization of these parking lots by commuters is assumed to not be available.

Table 5-7: Mode Splits to/from Station

Station	Exhibition Station	Danforth Station	Bloor Station	Average	Site Adopted

Notes:
1. Source: 2015 GO Rail Passenger Survey

5.4.3 Site Trip Generation

Based on the foregoing projected ridership and mode splits to/from the Station, the projected Site trip generation is summarized in Table 5-8.

Generally, the walking trips are expected to primarily originate from the substantial existing and proposed development within the Local area (herein defined as TTS zone 285, which includes the lands generally bound by Mimico Creek to the west, Gardiner Expressway to the north, Humber River to the east and Lake Ontario to the south), including the 2150 Lake Shore development and the Humber Bay Shores development.

Transit and PUDO trips are expected to primarily originate from development outside of the Local area, but generally within an approximate five minute drive, such as the neighbourhoods to the west of Park Lawn Road and to the north of the Gardiner Expressway.

Table 5-8: Projected Site Trip Generation – Near Term Horizon (2028)

Mode	Mode Split	AM Peak	PM Peak
Assumed Peak Hour Ridership		**1,050**	**1,050**
Auto Driver/Passenger	0%	0	0
Local Transit	30%	315	315
Walk	60%	630	630
Bicycle	5%	50	50
PUDO	5%	55	55

5.4.4 Site Vehicle Trip Generation

Based on the projected PUDO trips summarized in Table 5-8, the resultant projected vehicle trips are summarized in Table 5-9

Table 5-9: Projected Site Vehicle Trip Generation – Near Term Horizon (2028)

	AM Peak			PM Peak		
	Inbound	Outbound	Two Way	Inbound	Outbound	Two Way
Vehicle Trips	55	55	110	55	55	110

5.4.5 *Site Traffic Distribution*

As discussed in Section 5.4.3 above, PUDO trips to/from the Station are expected to primarily originate from development outside of the Local area, but generally within an approximate five minute drive, such as the neighbourhoods to the west of Park Lawn Road and to the north of the Gardiner Expressway. It is noted that commuters in the neighbourhoods to the west between Royal York Road and Park Lawn Road are likely to be split between Mimico GO Station and the Site, with those further to the west drawn to Mimico GO Station and those further to the east drawn to the Site.

The adopted distribution of PUDO trips is summarized in Table 5-10 and is based generally on the distribution of population within the abovementioned areas.

For the purpose of this assessment, PUDO is assumed to utilize Public Street C for access.

Table 5-10: Site Traffic Distribution

Route	Direction	Distribution
The Queensway	East	10%
	West	25%
Park Lawn Road	North	30%
Gardiner Expressway	East	0%
	West	0%
Lake Shore Boulevard West	East	0%
	West	35%
Total		**100%**

5.4.6 *Site Traffic Volumes*

The resultant Site traffic volumes are illustrated in Figure 5-10.

5.4.7 *Future Total Traffic Volumes*

The resultant future total traffic volumes are illustrated in Figure 5-11.

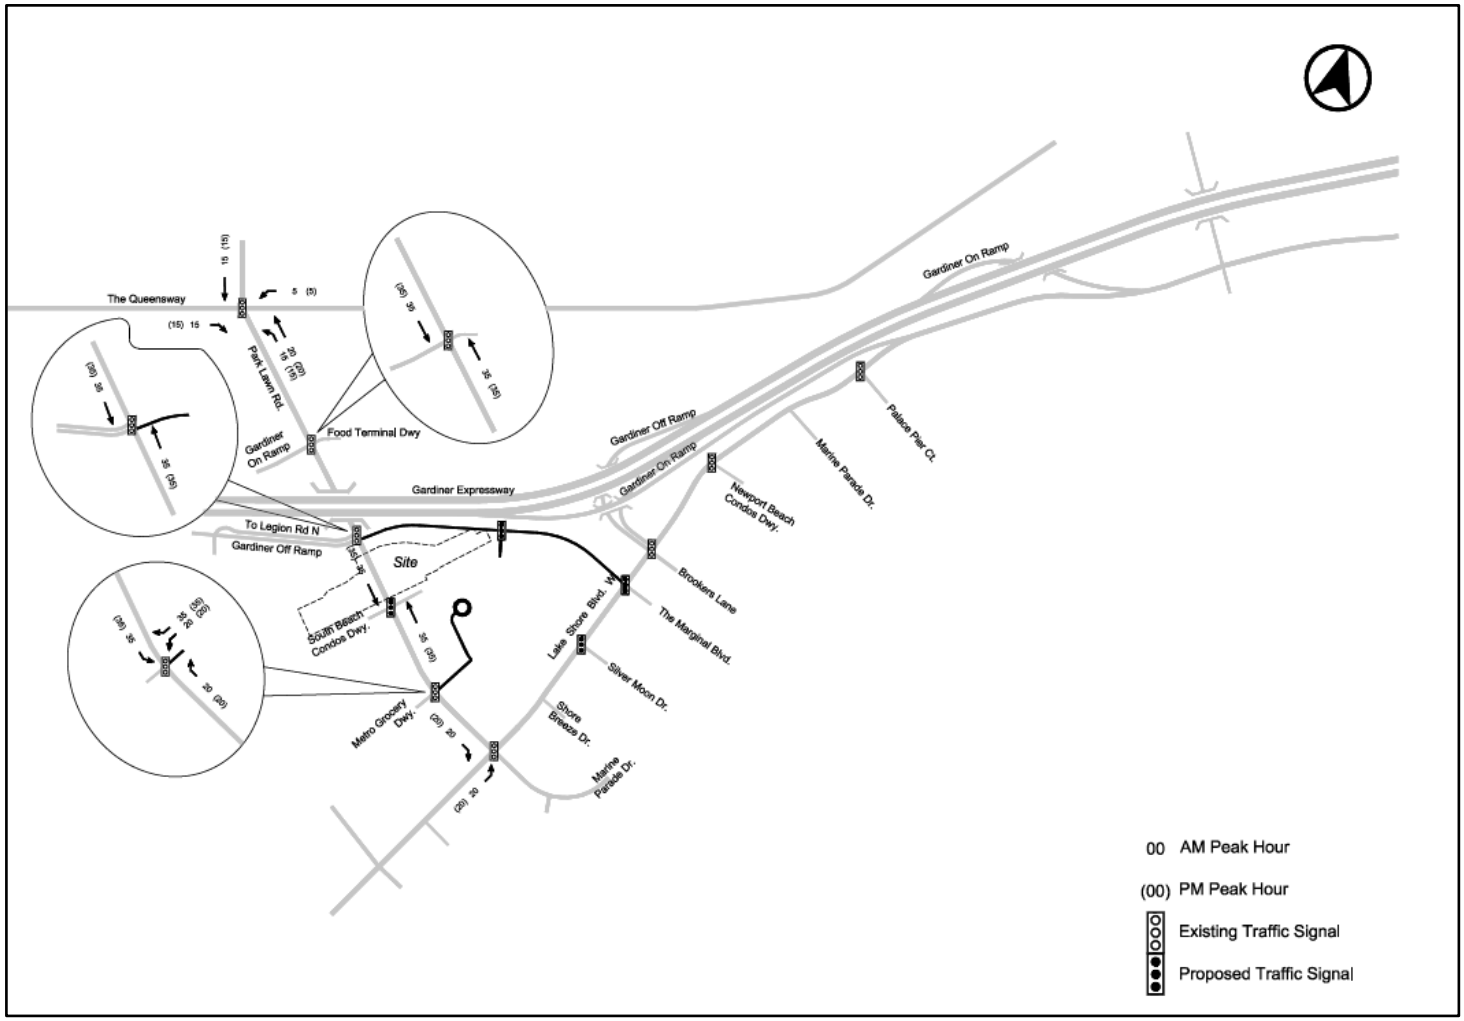

Figure 5-10: Near Term Horizon (2028) – Site Traffic Volumes

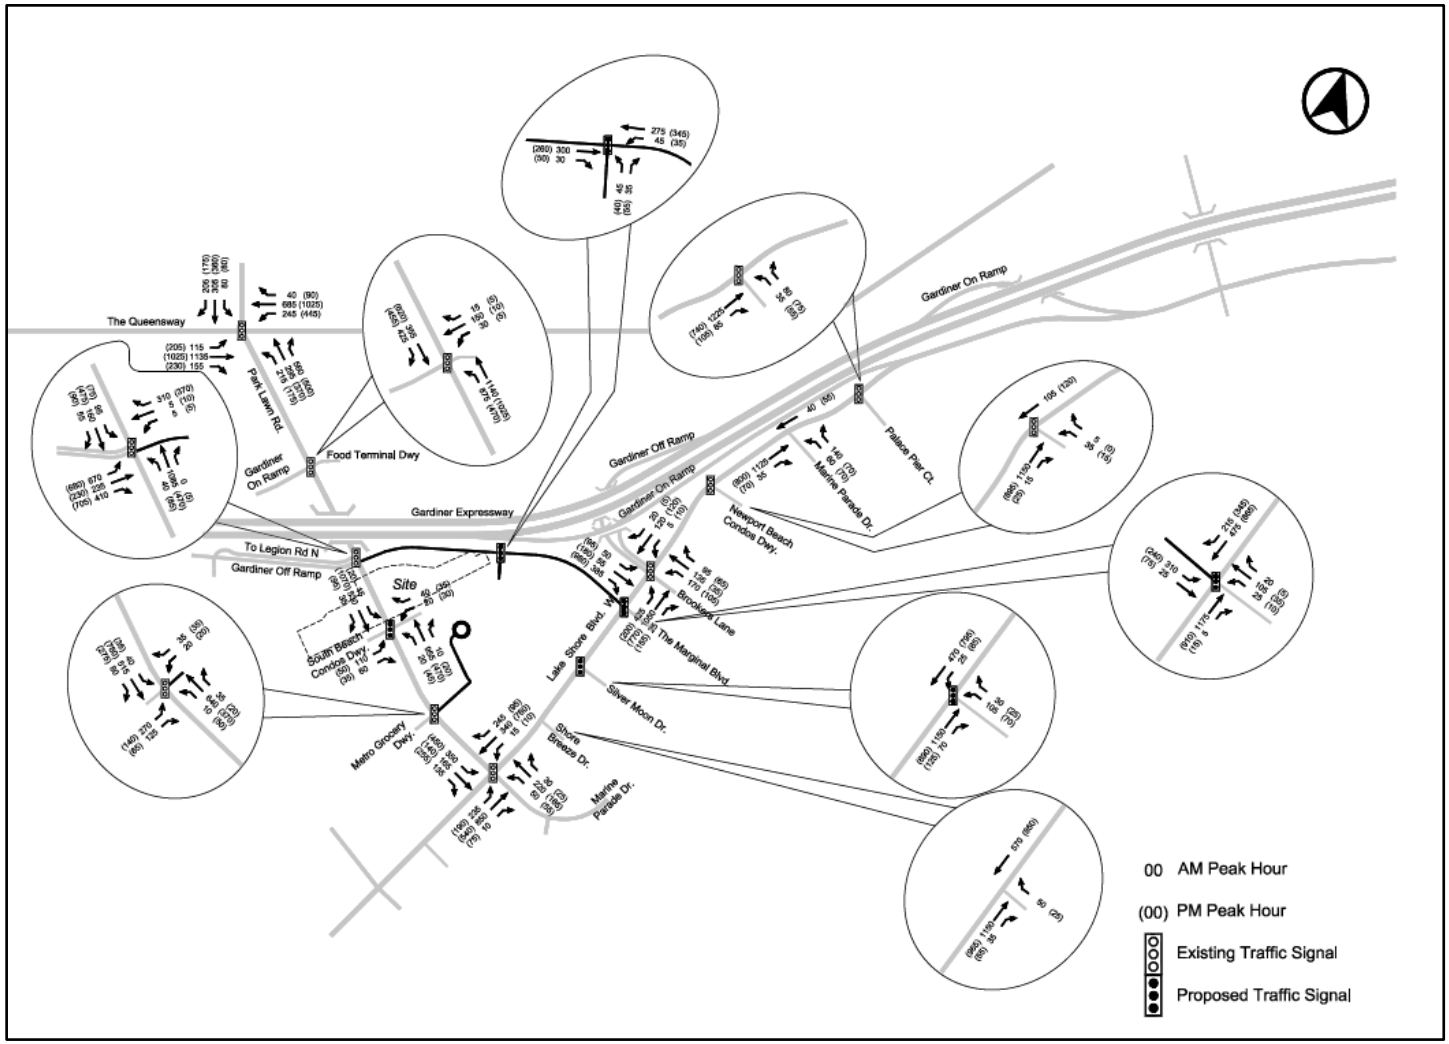

Figure 5-11: Near Term Horizon (2028) – Future Total Traffic Volumes

5.5 Park Lawn Go Station Impact Overview and Identification of Potential Effects and Mitigating Measures (As Appropriate)

5.5.1 Future Total Traffic Operations Analysis

5.5.1.1 Methodology and Assumptions

The methodology, model assumptions, network wide parameters and model calibrations remain generally consistent with those outlined in Section 4.3.3 for the Existing Conditions analysis, whilst the signal timing and conflicting pedestrian volume changes and peak hour factors for new intersections remain consistent with those outlined in Section 5.3.5 for the future background conditions.

5.5.1.2 Traffic Operations Analysis Results

The traffic operations analysis results for the Near Term Horizon (2028) future total conditions are shown graphically in Figure 5-12 and are summarized in Table 5-11 and Table 5-12 for signalized and unsignalized intersections respectively. For signalized intersections, movements approaching or over capacity with a V/C value over 0.90 and for unsignalized intersections, movements with a LOS F have been highlighted orange. The future total traffic operations Synchro reports are provided in Appendix G.

Overall, the results of the future total analysis are comparable to the results of the future background analysis results outlined in Section 5.3.5.3. This is consistent with the low projected traffic volumes associated with the GO Station.

Beyond the analysis Study Area (e.g., on Lake Shore Boulevard West and The Queensway to the west of Park Lawn Road, on Park Lawn Road to the north of The Queensway and on The Queensway to the east of Park Lawn Road), the Station is projected to generate no more than 20 vehicle trips on any one road section in each direction. This traffic is projected to subsequently be distributed further down the various side roads that service the adjacent areas, thereby minimizing the impact on individual movements. The impact of the traffic projected to be generated by the GO Station on intersections and movements beyond the analysis study area is therefore projected to be minimal.

As such, the impact of the proposed GO Station on the surrounding road network is considered to be minimal and there are no specific road network mitigating works recommended to support the GO Station which are not already proposed as part of the numerous other studies being prepared for the area.

5.5.2 GO Station Impacts and Mitigation Works

5.5.2.1 Road Network

As outlined in detail in Section 5.2.1, a number of road network improvements are proposed as part of other area background developments and studies and are assumed to be in place for the purpose of the Near Term Horizon analysis, including:

- Construction of Public Street A proposed as part of the 2150 Lake Shore development and contemplated by the Park Lawn Lake Shore TMP;
- Partial construction of the internal road network associated with the 2150 Lake Shore development;
- Construction of the Legion Road extension; and
- Signalization, lane configuration changes and signal timing changes at a number of intersections in the area, proposed as part of background developments to accommodate their respective projected vehicle trip generation and assumed to be in place for the Near Term Horizon.

As discussed in Section 5.4.4, the proposed GO Station is projected to generate in the order of 55 PUDO trips (equivalent to 110 two-way vehicle trips) in the Near Term Horizon, with access assumed via Public Street C.

The Synchro analysis outlined in Section 5.5.1.2 indicates that the impact of the Station on the area road network is minimal and that the road network improvements already contemplated as part of other area background developments and studies remain sufficient to accommodate the projected Station vehicle traffic. As such, there are no additional road network mitigating works proposed specifically to accommodate the Station.

5.5.2.2 Transit

5.5.2.2.1 Overview

As outlined in detail in Section 5.2.3, the construction of a mobility hub is proposed as part of the 2150 Lake Shore development.

For the Near Term Horizon, it is assumed that the proposed Park Lawn Road bus stops in close proximity to the Station will be operational, servicing existing bus routes along Park Lawn Road, as well as bus route 80 which is proposed to be diverted to the mobility hub.

The nearest bus stops are proposed to be located on Park Lawn Road approximately 50 metres to the south of the Station, adjacent to the proposed Park Lawn Road / South Beach Condos driveway / 2150 Lake Shore Boulevard West driveway signalized intersection and the pedestrian street proposed within the 2150 Lake Shore development. Bus stops will also be constructed on Park Lawn Road, adjacent to Public Street C.

In the Near Term Horizon, streetcars are assumed to continue to operate along Lake Shore Boulevard West as per Existing Conditions, with the nearest stops to the Station located at the Park Lawn Road / Lake Shore Boulevard West intersection.

With the above in place, the Station would be well served by local transit providing access to the surrounding areas, including:

- Bus route 80 servicing the Queensway corridor and surrounding neighbourhoods to the east and west of Park Lawn Road;
- Bus route 66 servicing the Park Lawn corridor and surrounding neighbourhoods to the north of The Queensway; and
- Streetcar routes 501 and 508 servicing the Lake Shore Boulevard West corridor and surrounding neighbourhoods to the east and west of Park Lawn Road.

Bus passengers would be able to travel between the Station and the bus stop via sidewalks along Park Lawn Road or via the pedestrian street and Station Square within the 2150 Lake Shore site. The proposed Park Lawn Road / South Beach Condos driveway / 2150 Lake Shore Boulevard West driveway signalized intersection will provide crossing opportunities for bus passengers as required.

Streetcar passengers would be able to travel between the Station and the streetcar stop via sidewalks along Park Lawn Road, with multiple signalized crossing opportunities along the corridor. Alternatively, a bus service could be taken along Park Lawn Road from the streetcar stops.

As discussed in Section 5.4.3, the proposed GO Station is projected to generate in the order of 315 transit trips in the Near Term Horizon. Overall, the above infrastructure and service changes are expected to provide adequate transit access to the Station.

5.5.2.2.2 Near Term Horizon (2028) Conditions Transit Assessment

A qualitative review of the transit infrastructure in the Near Term Horizon (2028) has been undertaken in accordance with the review criteria outlined in Section 4.3.3.1.

Transit Volumes:

- In addition to the existing local transit volumes outlined in Section 4.3.2, background development in the immediate area is projected to generate in the order of 670 and 600 local transit trips during the AM and PM peaks respectively (as outlined in Appendix H for the Humber Bay Shores, 2150 Lake Shore Boulevard West and 42 Park Lawn Road developments) and the Site is projected to generate in the order of 315 local transit trips during the AM and PM peak hours (as outlined in Section 5.4.3); and
- As discussed in Section 5.4.1, peak hour GO ridership at Park Lawn Station is assumed to be in the order of 1,050.

Availability:

- A number of streetcar and bus routes will continue to operate in the vicinity of the GO Station, with streetcar routes 501 (Queen) and 508 (Lake Shore) and bus routes 66 (Prince Edward), 80 (Queensway), operating along Park Lawn Road and/or Lake Shore Boulevard West in close proximity to the Site;
- GO Train service will be available at the new Park Lawn Station, improving accessibility to Downtown Toronto, with no transfers required; and
- With the introduction of the GO Station, transit trips between the Site area and Downtown Toronto are expected to increase and subsequently result in a reduction to the percentage of transit trips requiring transfers.

Access:

- Existing bus and streetcar stops are located along Lake Shore Boulevard West, whilst new bus stops will be constructed on Park Lawn Road in close proximity to the Station;
- Existing and proposed signalized intersections in the area will provide crossing locations for pedestrians; and
- Park Lawn GO Station will be readily accessible via multiple entrances.

Capacity:

- It is expected with the proposed development in the area, transit scheduling would substantially change from existing, with a view to accommodating future ridership in the area.

Operations:

- Existing and proposed bus and streetcar stops in the vicinity are generally accompanied by a shelter;
- Bus and streetcar services will generally operate in mixed traffic conditions; and

- The Park Lawn GO Station and Park Lawn Road bus services will be integrated, with seamless transfer between them. Transfer from streetcar services and Lake Shore bus services is also readily available by walking along Park Lawn Road or by transferring to a bus service along Park Lawn Road.

5.5.2.3 Pedestrian

5.5.2.3.1 Overview

As outlined in detail in Section 5.2.4.1, a number of pedestrian network improvements are proposed as part of the 2150 Lake Shore development and are assumed to be in place for the purpose of the Near Term Horizon, including:

- Upgrades to the existing sidewalks along the east side of Park Lawn Road, most notably an increase to the offset of the sidewalk from the Park Lawn Road carriageway;
- Construction of sidewalks along the south side of the proposed Public Street A;
- Sidewalks along the proposed internal road network associated with the 2150 Lake Shore background development;
- Additional pedestrian areas within the 2150 Lake Shore site, including:
    - The pedestrian plaza connecting between Park Lawn Road and the 2150 Lake Shore internal road network; and
    - Station Square connecting between the Station and the 2150 Lake Shore internal road network.
- New crossing opportunities proposed at new signalized intersections.

As discussed in Section 5.5.2.2, the proposed pedestrian infrastructure provides appropriate access between the Station and local transit stops. Similarly, pedestrian infrastructure will be available for PUDO passengers.

In a general sense, the proposed upgrades to the sidewalks along Park Lawn Road and the proposed new sidewalks along Public Street A, in combination with existing sidewalks along Lake Shore Boulevard West and along Park Lawn Road will provide pedestrian access to / from the Station in all key directions, with the improved permeability of the 2150 Lake Shore site further facilitating Station access. Crossing opportunities will also be available at multiple signalized intersections within the vicinity of the Site.

As discussed in Section 5.3.3, the proposed GO Station is projected to generate in the order of 630 pedestrian trips in the Near Term Horizon, with additional trips associated with walking to/from transit stops (315 trips), PUDO facilities (55 trips) and bicycle parking (50 trips). Overall, the above infrastructure is expected to provide adequate pedestrian access to the Station.

5.5.2.3.2 Near Term Horizon (2028) Conditions Pedestrian Assessment

A qualitative review of the pedestrian infrastructure in the Near Term Horizon (2028) has been undertaken in accordance with the review criteria outlined in Section 4.2.6.1.

Pedestrian Volumes:

- In addition to the existing pedestrian volumes outlined in Section 4.2.5 (in the order of 200 along both Lake Shore Boulevard West during the AM and PM peak hours and in the order of 100 along Park Lawn Road in the AM and PM peak hours), background development in the immediate area is projected to generate in the order of 535 and 855 pedestrian trips during the AM and PM peaks respectively (as outlined in Appendix H for the Humber Bay Shores, 2150 Lake Shore Boulevard West and 42 Park Lawn Road developments) and the Site is projected to generate in the order of 630 pedestrian trips during the AM and PM peak hours (as outlined in Section 6.4.1.2). Additional pedestrians associated with transfers between transit services, PUDO and bicycle parking will also be present.

Walking:

- The sidewalk along the east side of Park Lawn Road between Public Street 'C' and Public Street A will be upgraded.

Waiting/Crossing:

- Formal pedestrian crossings will be provided at existing and proposed signalized intersections; and
- Proposed signalized intersections will reduce distance between crossing points.

Connecting:

- Sidewalks are generally provided along both sides of Park Lawn Road and Lake Shore Boulevard West in the vicinity of the Site, with new pedestrian infrastructure proposed along Public Street A and parts of the 2150 Lake Shore site;
- Crossing opportunities will increase with the proposed signalized intersections;
- There is a gap in the pedestrian network along the north side of Lake Shore Boulevard, east of The Marginal Boulevard; and
- The 2150 Lake Shore site will still be partially impermeable, however Public Street A will improve through access from Lake Shore Boulevard West to Park Lawn Road and the Station will be accessible through new infrastructure built within the 2150 Lake Shore site.

Accessible:

- Intersections in the vicinity of the Site generally accommodate all patrons regardless of age or ability.

5.5.2.4 Cycling

5.5.2.4.1 Overview

As outlined in detail in Section 5.2.4.2, assumed bicycle network improvements in the Near Term Horizon include the two-way cycling facility proposed along Park Lawn Road as part of the 2150 Lake Shore development.

The cycling facility is expected to provide access to the Station's bicycle parking direct from Park Lawn Road.

Existing bicycle trails in the area, including the Martin Goodman Trail and Mimico Creek Trail will continue to provide bicycle access to the area.

As discussed in Section 5.4.3, the proposed GO Station is projected to generate in the order of 50 bicycle trips in the Near Term Horizon. Overall, the above infrastructure is expected to provide adequate bicycle access to the Station.

5.5.2.4.2 Near Term Horizon (2028) Conditions Bicycle Assessment

A qualitative review of the bicycle infrastructure in the Near Term Horizon (2028) has been undertaken in accordance with the review criteria outlined in Section 4.2.4.1.

Cycling Volumes:

- In addition to the existing cycling volumes outlined in Section 4.2.3 (in the order of 10 along both Park Lawn Road and Lake Shore Boulevard West during the AM and PM peak hours), background development in the immediate area is projected to generate in the order of 125 and 125 bicycle trips during the AM and PM peaks respectively (as outlined in Appendix H for the Humber Bay Shores, 2150 Lake Shore Boulevard West and 42 Park Lawn Road developments) and the Site is projected to generate in the order of 50 bicycle trips during the AM and PM peak hours (as outlined in Section 6.4.1.25.4.3).

Parking/Sharing:

- An existing Toronto Bike Share Station is located near the Site; and
- Bicycle parking will be provided at the Park Lawn GO Station.

Connecting:

- The Site is located in close proximity to a number of existing off-road trails and recreational facilities, including the Humber Bay Park East Trail, the Humber Bay Shores Park, the Humber Bay Park East and West Parks and the Jean Augustine Park; and
- A two-way cycle track will be constructed along Park Lawn Road, providing a connection between the Station and the off-road trails to the south.

Support:

- There is currently limited bicycle support facilities in the vicinity of the Site.

5.6 GO Station Facilities Review (Near Term)

As previously discussed, the completion date of the new GO Station is planned to coincide with the completion of the first phase of the 2150 Lake Shore development. Given that the entirety of the 2150 Lake Shore development will not be completed by the Near Term Horizon (2028), the following section outlines the Near Term transportation strategy for the station and its surrounding area.

5.6.1 Vehicular Pick-up / Drop-off Strategy

As previously discussed, no Station related commuter parking will be provided as part of the proposed Park Lawn GO Station. For persons arriving by vehicle or accessible vehicles (paratransit/TTC WheelTrans), designated areas within the Station building proximity will allow for PUDO activity to occur.

5.6.1.1 General Passenger / Vehicular Drop-Off

General PUDO is currently contemplated within the 2150 Lake Shore development.

5.6.1.2 Wheel-Trans / Para-Trans Facilities

The design of the Station balances the planned urban nature of the area with the need to provide immediate PUDO for persons with disabilities, currently contemplated along Public Street A and providing for the staging of wheel-trans and other para-trans vehicles. An appropriate access path to the Station will be provided.

5.6.2 Transit Integration

The Park Lawn GO Station will be a part of a multi-modal transit hub in the Humber Bay Shores neighbourhood where local bus and streetcar services will converge to allow seamless transfer.

5.6.2.1 Surface Bus Routes

As previously discussed, in the Near Term Horizon (2028), new 28 metre bus platforms will be constructed along Park Lawn Road adjacent to the GO Station and at Public Street C. The location of these stops will allow for the services to remain “on-line” and minimize rerouting and delay in service times.

The abovementioned bus stops will place bus passengers within close proximity of the Station and within a short walk to the many Station entrances, as shown in Figure 5-13. The pedestrian street connecting Park Lawn Road and Public Street B (Loop Road) will provide a safe route for passengers to access the upper Station level and the eastbound train platform. A Station entrance on the east side of Park Lawn Road at the rail corridor provides access to the lower Station level for passengers and the pedestrian tunnel to the westbound train platforms. Secondary platform accesses are also planned on the west side of Park Lawn Road.

5.6.2.2 TTC Streetcar

In the Near Term Horizon (2028), streetcar services will remain on Lake Shore Boulevard as the construction of Public Street B (Loop Road) streetcar tracks and the streetcar station facility will not be completed. Passengers transferring between the GO Station and the 501 Queen / 508 Lake Shore streetcar services will have the option of walking along the pedestrian facilities provided on Park Lawn Road or by using bus services.

The distance between the Station and the existing streetcar platforms at the Lake Shore Boulevard West / Park Lawn Road / Marine Parade Drive intersection is approximately 350 metres.

5.6.3 Pedestrian Facilities

Pedestrian mobility is emphasized, aiming to provide for a safe and attractive public realm. As previously discussed, it is anticipated that a large percentage of Station passengers will be arriving from the surrounding area on foot. Numerous pedestrian spaces, and widened boulevards, contemplated as part of the development proposal aim to link the various components of the Transit Hub, and also provide a welcoming environment for those arriving to the Station on foot.

5.6.3.1 *Linking the components of the Transit Hub*

The Park Lawn GO Station is proposed as a multi-modal transit hub that offers connections to regional rail, streetcar and local bus services. High quality pedestrian spaces as previously shown in Figure 5-4, such as Station Square and the pedestrian street off Park Lawn Road, will be completed in the Near Term Horizon (2028) and will provide the initial pedestrian connections from the Park Lawn Road bus platforms to the upper level of the GO Station building entrance and streetcar platforms.

A widened pedestrian boulevard along Park Lawn Road will provide for a safe and pleasant pedestrian route to the GO Station. Park Lawn Road will serve as the linkage between streetcar services on Lake Shore Boulevard West and the bus and regional rail services at the Station, as well as the numerous residents of the Humber Bay Shores neighbourhood who are within walking distance of the proposed GO Station.

5.6.3.2 *Station Pedestrian Entrances*

In addition to the pedestrian entrance provided from Station Square, at the upper level of the Station building, entrances to the lower level of the Station will be provided on the north side of the rail corridor (accessible from Public Street A), and from an entrance on the east side of Park Lawn Road, just south of the rail corridor.

Secondary accesses to the rail platforms will be provided on the north and south side of the rail corridor, on the west side of Park Lawn Road.

The Station entrance located on the north side of the rail corridor, will provide for convenient access to / from the existing development along Legion Road North, and future developments north of the GO Station.

5.6.4 Cycling Facilities

Cycling is acknowledged as an important and strong last-mile mode of transportation, significantly expanding the catchment area of transit nodes / hubs with numerous high-quality cycling facilities planned.

5.6.4.1 *Cycling Network and Access Routing*

As previously discussed and shown in Figure 5-5, a two-way cycle track (minimum 3 metres wide) is being proposed on the east side of Park Lawn Road between Lake Shore Boulevard West and Public Street A as part of the 2150 Lake Shore development. This facility will provide an off-street cycling connection for residents in the area to safely cycle to / from the new GO Station.

In the Near Term Horizon (2028), a portion of the final alignment of the two-way cycle track will be completed between Public Street A and Public Street C, while a temporary two-way cycling facility between Lake Shore Boulevard and Public Street C will be constructed to provide a connection to the Martin Goodman trail head at Lake Shore Boulevard.

The Park Lawn Road cycling facility ultimately provides a connection for area residents to access the lower level of the proposed Station building, where bicycle parking facilities are proposed to be provided.

5.6.4.2 Bicycle Parking Facilities

Station bicycle parking facilities are being planned as part of the Near Term Horizon (2028) considerations. Bicycle parking at the Station will make cycling a more attractive “last-mile” mode of transportation for the residents living within a short bicycle ride from the proposed GO Station.

At this time, a minimum of 192 covered bicycle parking spaces are to be provided within the Station precinct to support the anticipated demand for bicycle parking. An additional minimum of 96 secured bicycle spaces are to be integrated into the 2150 Lake Shore development.

Access to the secured bicycle parking room on the lower level (96 spaces) will be from Park Lawn Road and the proposed two-way cycle track. The room will be integrated into the basement of the 2150 Lake Shore development block D1, but public access will be granted from the Station building.

The 192 covered bicycle parking spaces will be generally located at-grade, in highly visible, key locations relative to the proposed GO Station entrances.

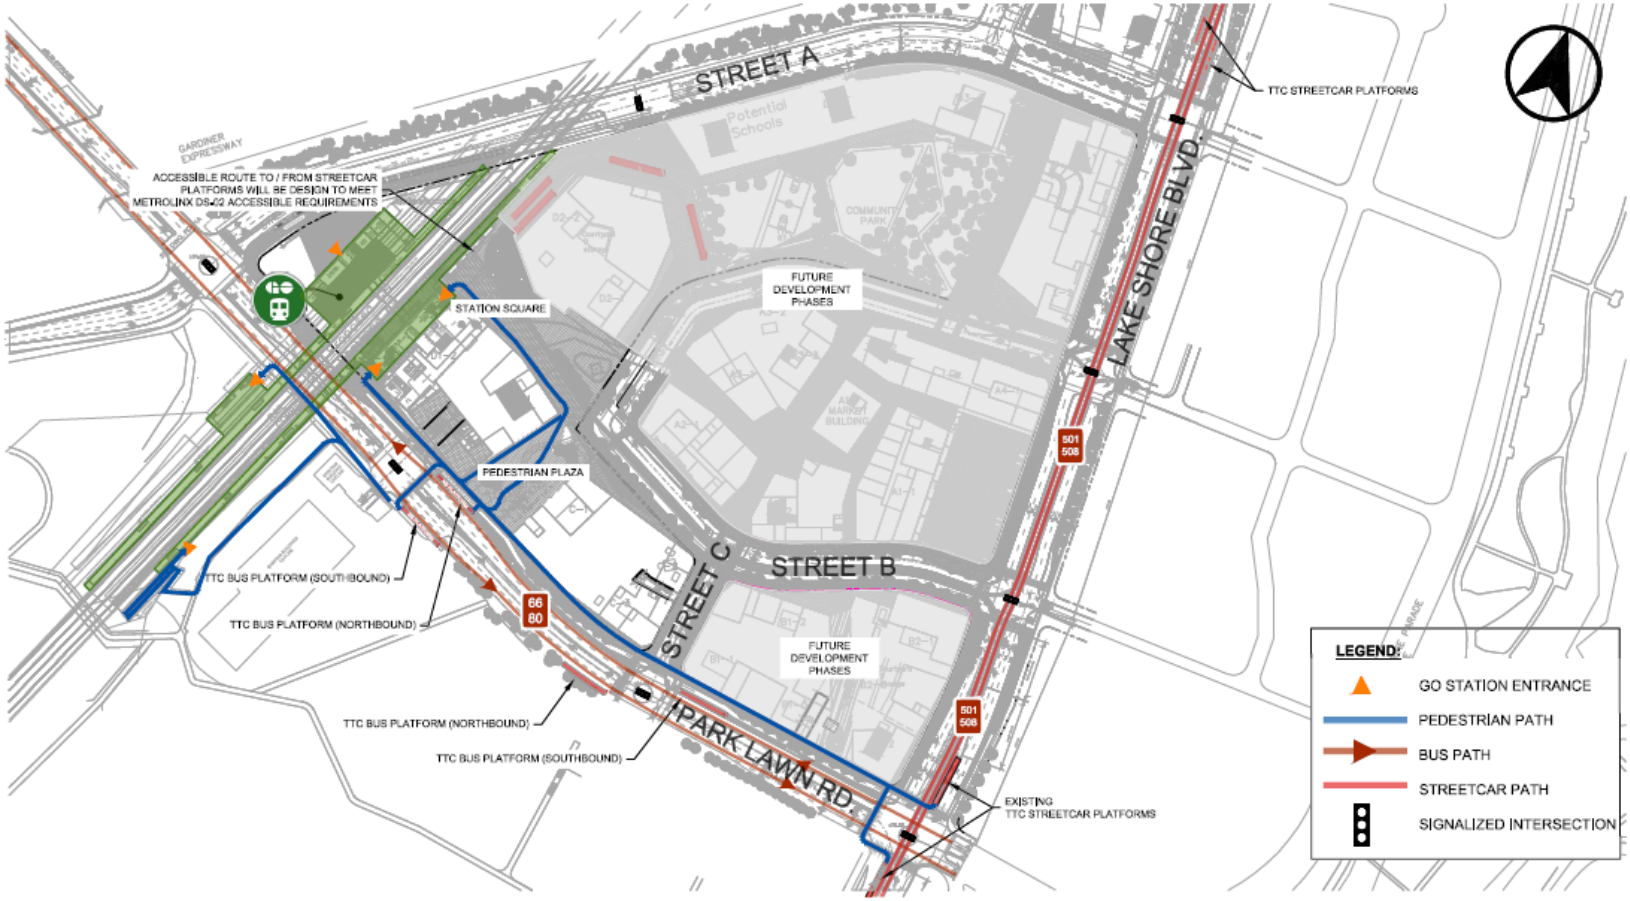

Figure 5-13: Bus Stop Pedestrian Access Routes

6. Longer Term Horizon Conditions

6.1 Area Development and Infrastructure Planning Context

6.1.1 Development Forecasts

The planned development adjacent to the GO Station will introduce a mix of complementary uses and changes in mobility that will influence the existing population and employment conditions.

In addition to existing populations within the immediate Site area (for the purpose of this assessment, assumed generally to include development within TTS zone 285) which are in the order of 11,400 people, key developments include the 2150 Lake Shore development, the Humber Bay Shores development and the 42 Park Lawn Road development.

Details of the Humber Bay Shores and 42 Park Lawn Road developments were previously outlined in Table 5-1, whilst the currently proposed development stats for the full-build out of the 2150 Lake Shore development include in the order of:

- 7,500 residential units;
- 63,000 square metres of employment use;
- 36,000 square metres of retail use; and
- Two schools with a combined enrolment of 1,100 students.

6.1.1.1 Future Population and Employment Forecasts

Based on the foregoing, in the order of 11,000 residential units are proposed to be constructed within the immediate Site area under the Longer Term Horizon (2041). Data sourced from the 2016 TTS indicates typical household densities in the area of 1.65 people per dwelling, which equates to new population in the order of 18,200 people. In conjunction with the existing population of in the order of 11,400 people, this equates to a projected future population of 29,600 people within the immediate Site area under the Longer Term Horizon (2041).

With regards to proposed employment, a job density in the order of 1 job per 20 square metres is assumed, which equates to in the order of 3,200 jobs for the proposed 63,000 square metres of employment within the 2150 Lake Shore site.

6.2 Transportation Context Overview

6.2.1 Street Network Changes

A number of street network changes were outlined in Section 5.2.1 which are considered within the ongoing Christie's Planning Study and Park Lawn Lake Shore TMP, as well as other area development studies and are expected to be implemented by the Near Term Horizon (2028). Additional street network changes are proposed as part of the full build-out of the 2150 Lake Shore site which are not expected to occur until after the Near Term Horizon (2028), but which are assumed to be in place for the Longer Term Horizon (2041).

Accordingly, building on the above improvements previously outlined in Section 5.2.1, an overview of the additional road-related changes for the Longer Term Horizon (2041) are outlined in the following sections. The Longer Term Horizon (2041) road network is shown graphically in Figure 6-1.

6.2.1.1 2150 Lake Shore Boulevard West Internal Network

Under the Longer Term Horizon (2041), the remainder of the 2150 Lake Shore development's internal road network will be completed, including the construction of Private Street D, providing an east-west connection between Public Street B (Loop Road) and Public Street A, and the completion of Public Street B (Loop Road).

Public Street B (Loop Road) is proposed to connect to Lake Shore Boulevard West at Shore Breeze Drive and Silver Moon Drive and loop through the development. Both intersections with Lake Shore Boulevard West will be signalized, with associated lane configuration changes as proposed by the 2150 Lake Shore development. The Public Street B (Loop Road) / Public Street C intersection is also proposed to be signalized with the completion of Public Street B (Loop Road).

Public Street B (Loop Road) will serve as a "main spine" connection in the form of a complete street, primarily servicing diverse mobility users of the 2150 Lake Shore Boulevard property and new transit hub, including the GO Station.

6.2.1.2 Park Lawn Road Improvements

Further to the widening of Park Lawn Road undertaken within the Near Term Horizon (2028) between Public Street A and Public Street C, the remaining section of Park Lawn Road along the 2150 Lake Shore property frontage (between Public Street C and Lake Shore Boulevard West) will also be widened by in the order of six to eight metres under the Longer Term Horizon (2041). Furthermore, the Park Lawn Lake Shore TMP is currently contemplating two traffic lanes along Park Lawn Road in the future.

6.2.1.3 Lake Shore Boulevard West Improvements

As part of the 2150 Lake Shore development and as contemplated by the Park Lawn Lake Shore TMP, a number of physical changes are proposed along the Lake Shore Boulevard West corridor between Park Lawn Road and Brooker's Lane.

Specifically, Lake Shore Boulevard West is proposed to be widened by three metres, which will fulfil the preferred width as designated in the City of Toronto Official Plan. The proposed cross section includes cycle tracks along both sides of Lake Shore Boulevard and allows the streetcar tracks to operate independently of the traffic lanes.

These changes will be implemented and in place for the Longer Term Horizon (2041).

6.2.1.4 New North-South Street

The Park Lawn Lake Shore TMP is contemplating a new north-south street extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner

Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street.

It is assumed this road would be constructed for the Longer Term Horizon (2041).

6.2.2 *Transit Network Changes*

A number of transit network changes were outlined in Section 5.2.3 which are proposed as part of the 2150 Lake Shore development and are contemplated by the Park Lawn Lake Shore TMP and are expected to be implemented by the Near Term Horizon (2028). Additional transit network changes are proposed as part of the full build-out of the 2150 Lake Shore site and as contemplated by the Park Lawn Lake Shore TMP which are not expected to occur until after the Near Term Horizon (2028), but which are assumed to be in place for the Longer Term Horizon (2041).

Accordingly, building on the above improvements previously outlined, an overview of the additional transit-related changes for the Longer Term Horizon (2041) are outlined in the following sections. The Longer Term Horizon (2041) transit network is shown graphically in Figure 6-2.

6.2.2.1 *Mobility Hub*

Under the Longer Term Horizon (2041), the remainder of the mobility hub will be completed, including the construction of the streetcar tracks along Public Street B (Loop Road) and subsequent streetcar stops adjacent the Station.

6.2.2.2 *TTC Route Adjustments*

With the completion of the mobility hub under the Longer Term Horizon (2041), existing streetcar services operating along Lake Shore Boulevard West (501 Queen and 508 Lake Shore) are proposed to reroute into the 2150 Lake Shore development and stop at the mobility hub. The mobility hub will allow streetcars to better serve as a transit feeder route for the Park Lawn GO Station and improve passenger transfers between different transit modes.

6.2.3 *Active Transportation Network Changes*

A number of active transportation network changes were outlined in Section 5.2.4 which are proposed as part of the 2150 Lake Shore development and are expected to be implemented by the Near Term Horizon (2028). Additional active transportation network changes are proposed as part of the full build-out of the 2150 Lake Shore site which are not expected to occur until after the Near Term Horizon (2028), but which are assumed to be in place for the Longer Term Horizon (2041).

Accordingly, building on the above improvements previously outlined, an overview of the additional active transportation-related changes for the Longer Term Horizon (2041) are outlined in the following sections. The Longer Term Horizon (2041) pedestrian and bicycle network are shown graphically in Figure 6-3 and Figure 6-4 respectively and are compared against the Near Term Horizon (2028) in Figure 6-5 and Figure 6-6 respectively.

6.2.3.1 *Pedestrian Infrastructure*

Additional pedestrian infrastructure proposed as part of the 2150 Lake Shore Boulevard West site and assumed to be in place for the Longer Term Horizon (2041) include:

- Improvements to the existing sidewalks along the east side of the remaining section of Park Lawn Road on the 2150 Lake Shore development frontage (between Public Street C and Lake Shore Boulevard West);
- Construction of sidewalks along the remainder of Public Street B (Loop Road) and Private Street D;
- Additional pedestrian amenity as part of the 2150 Lake Shore development, including:
    - A 1.0 hectare public park located at the northern end of the 2150 Lake Shore development, which will improve the public realm and introduce municipal community facilities for the neighbourhood;
    - A new boulevard square, located adjacent to Lake Shore Boulevard West which will help connect surrounding spaces within the 2150 Lake Shore development; and
    - The “Galleria” public space, located in the centre of the 2150 Lake Shore Boulevard site which will enhance connections through the property.
- Sidewalks with a width of three metres will be incorporated into the upgrades along Lake Shore Boulevard West; and
- Additional signalized crossing opportunities along Lake Shore Boulevard West.

6.2.3.2 *Bicycle Infrastructure*

Additional bicycle infrastructure proposed as part of the 2150 Lake Shore site and the Park Lawn Lake Shore TMP and assumed to be in place for the Longer Term Horizon (2041) include:

- Completion of the two-way cycle track on the east side of Park Lawn Road along the remaining section of Park Lawn Road between Public Street C and Lake Shore Boulevard West and more generally, bicycle facilities along the remainder of Park Lawn Road;
- Construction of bicycle lanes along both sides of Lake Shore Boulevard West;
- Construction of bicycle facilities along the new north-south road and The Queensway; and
- Completion of the two-way cycle track along the remainder of Public Street B (Loop Road).

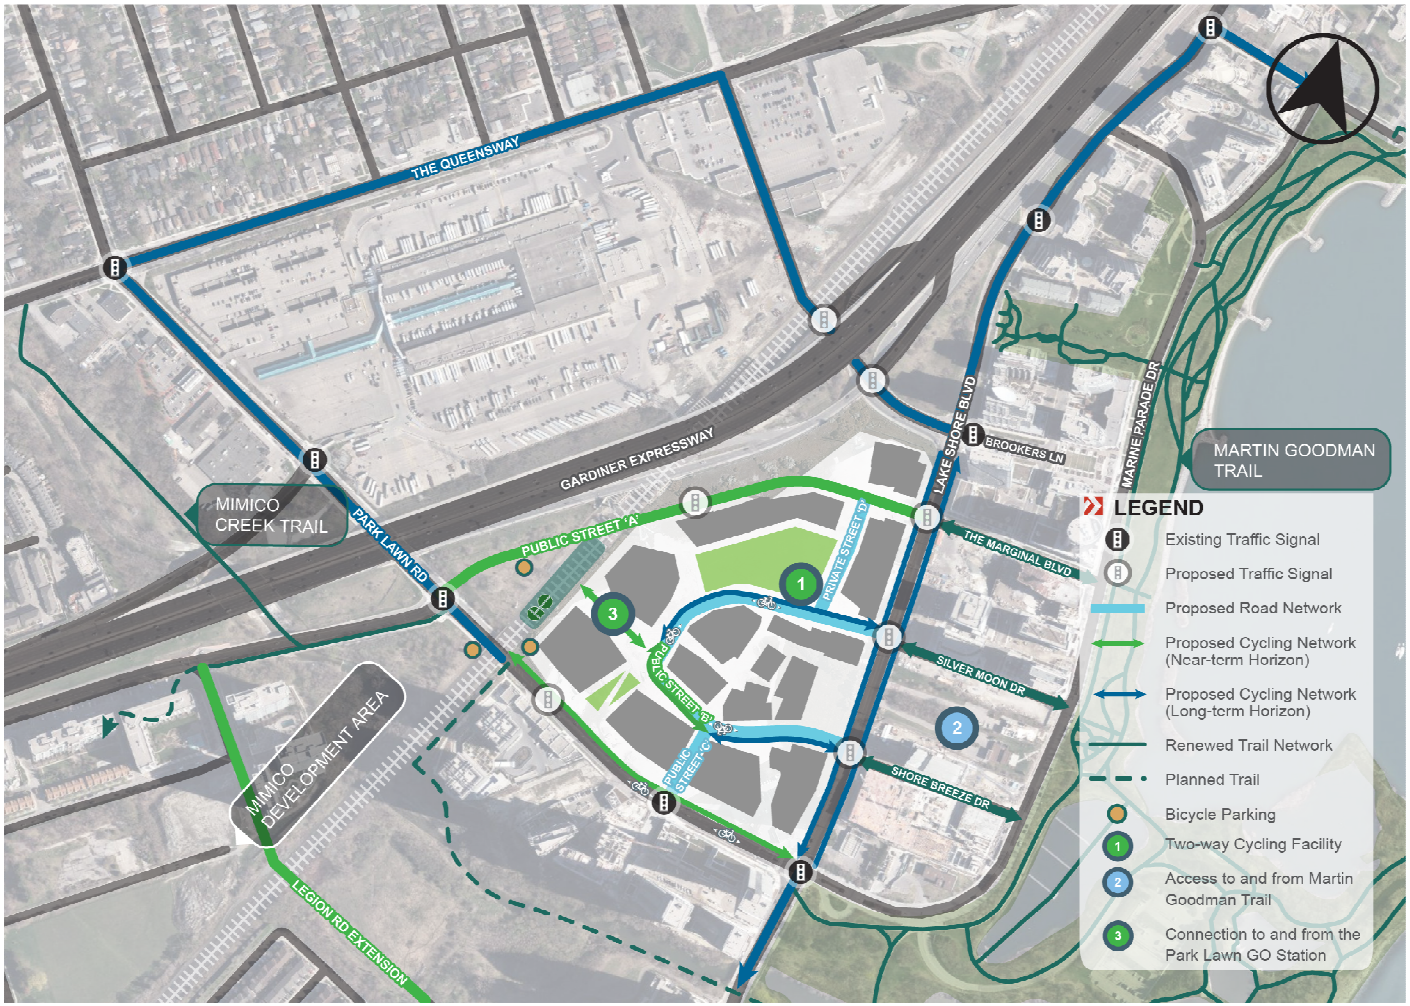

Figure 6-6: Near Term (2028) and Longer Term (2041) Horizons Bicycle Network

6.3 Park Lawn GO Station in Context

With substantial existing and planned development in the area along with significant transit and active transportation investment, the Park Lawn GO Station is expected to operate as an urban station.

Notably, the development in the area provides substantial potential ridership, with the transit and active transportation investment facilitating convenient walk, cycle and transit access to the Station.

Conversely, the Station itself will significantly influence travel patterns in the area, providing regular and convenient access to across the Greater Toronto Area, including to/from Downtown Toronto (12 minutes), Liberty Village (8 minutes), East Harbour (16 minutes) and beyond. In this respect, a significant proportion of auto-based travel has the potential to shift to utilize these enhanced transit services, serving to reduce current car reliance and usage levels and suppress area traffic activity level growth.

6.4 Park Lawn GO Station Impact Overview and Identification of Potential Effects and Mitigating Measures

6.4.1 Park Lawn Go Station Activity Level Forecasts

6.4.1.1 Assumed GO Ridership

As discussed in Section 5.4.1, the IBC 2020 provided two sets of ridership projections as follows:

- **Economic Case:** Ridership projections for a 2041 horizon year, based on a 2031 horizon year service plan; and
- **Sensitivity Test:** Ridership projections for a 2041 horizon year, with an increased service sensitivity for improvements that may be made between 2031 and 2041, but are currently unfunded.

Given the Sensitivity Test refers to a 2041 horizon year with potential service improvements made between 2031 and 2041, it is considered reasonable to adopt the ridership projections for the Sensitivity Test for the purpose of this Longer Term Horizon (2041). The IBC 2020 notes that details of the assumed service plan are not presented as it is a representative exercise that does not correlate to any planned or funded commitment on the corridor, but is technically feasible to implement and not outside of the realm of possibilities of what could be implemented.

Consistent with the Near Term Horizon (2028), the ridership projections for the Integrated Fare scenario have been adopted, whilst it is assumed that the PM peak two-way ridership is consistent with the AM peak two-way ridership.

The resultant projected Station ridership is outlined in Table 6-1. As shown, a peak hour two-way ridership of 1,600 has been adopted for the purpose of the following projections.

Table 6-1: Projected Station Ridership – Longer Term Horizon (2041)

	Two Way Projected Ridership
IBC 2020 Economic Case Integrated Fare Scenario AM Peak Period (3 hr) Ridership	3,200
Assumed Percentage of Peak Period (3 hr) Ridership Occurring During Peak Hour (1 hr)	50%
Assumed Peak Hour Ridership	**1,600**

Notes:
1. Source: 2015 GO Rail Passenger Survey

6.4.1.2 Site Trip Generation

Adopted mode splits for trips to/from the proposed Station under the Longer Term Horizon (2041) remain consistent with the Near Term Horizon (2028). Accordingly, the projected Site trip generation is summarized in Table 6-2.

Table 6-2: Projected Site Trip Generation – Longer Term Horizon (2041)

Mode	Mode Split	AM Peak	PM Peak
Assumed Peak Hour Ridership		**1,600**	**1,600**
Auto Driver/Passenger	0%	0	0
Local Transit	30%	480	480
Walk	60%	960	960
Bicycle	5%	80	80
PUDO	5%	80	80

6.4.2 GO Station Impact Overview and Mitigation Works

6.4.2.1 Road Network

A detailed review of the Longer Term Horizon (2041) is being undertaken through other ongoing area studies, in particular the Park Lawn Lake Shore TMP and the Christie's Planning Study. These studies will ultimately review and estimate the future transportation demands of the area, including the proposed Station, and subsequently, determine the infrastructure to be delivered to support these transportation demands.

In a general sense however, it is worth noting that as previously discussed, the Station is expected to operate as an urban station, primarily relying on walk, cycle and transit trips to and from the Station from the substantial population and employment in the area.

No commuter parking is proposed and in this regard, vehicle trips will be limited to PUDO trips. As outlined in Table 6-2, in the order of 80 PUDO trips (160 two-way vehicle trips) are projected in the Longer Term Horizon (2041), based on ridership numbers projected in the IBC 2020 for

the Sensitivity Test. In the context of the proposed area development, this level of traffic is not expected to have a significant impact on the operation of the surrounding road network.

Furthermore, the Station itself will significantly influence travel patterns in the area and has the potential to result in a notable shift in transportation mode splits in the area to reduce auto reliance and increase transit mode utilization. As such, whilst the Station is projected to generate some vehicle trips associated with PUDO, on a broader scale, the Station itself is actually expected to reduce vehicle trips generally in the area.

6.4.2.2 Transit

6.4.2.2.1 Overview

As outlined in Section 5.5.2.2, a number of transit improvements are expected to be completed under the Near Term Horizon (2028) which will improve transit access to and from the Site, including upgraded bus stops on Park Lawn Road adjacent to the Station and rerouting of the existing bus route 80 to the Site area.

Building upon the above, in the Longer Term Horizon (2041), the construction of the mobility hub is expected to be completed, with streetcar routes 501 and 508 diverting into the 2150 Lake Shore development and stopping adjacent to the Station, further increasing the convenience of transfers between GO train and TTC streetcar services.

As discussed in Section 6.4.1.2, the proposed GO Station is projected to generate in the order of 480 transit trips in the Longer Term Horizon (2041). Overall, the above infrastructure and service changes are expected to provide adequate transit access to the Station.

6.4.2.2.2 Longer Term Horizon (2041) Conditions Transit Assessment

A qualitative review of the transit infrastructure in the Longer Term Horizon (2041) has been undertaken in accordance with the review criteria outlined in Section 4.3.3.1.

Availability:

- A number of streetcar and bus routes will continue to operate in the vicinity of the GO Station, with streetcar routes 501 (Queen) and 508 (Lake Shore) and bus routes 66 (Prince Edward), 80 (Queensway), operating along Park Lawn Road and/or Lake Shore Boulevard West in close proximity to the Site;
- GO Train service will be available at the new Park Lawn Station, improving accessibility to Downtown Toronto, with no transfers required; and
- With the introduction of the GO Station, transit trips between the Site area and Downtown Toronto are expected to increase and subsequently result in a reduction to the percentage transit trips requiring transfers.

Access:

- Bus stops will be located along Lake Shore Boulevard West and Park Lawn Road adjacent the Station. Streetcar stops will be located along Lake Shore Boulevard West and within the new mobility hub adjacent to the Station;
- Existing and proposed signalized intersections in the area will provide crossing locations for pedestrians; and
- Park Lawn GO Station will be readily accessible via multiple entrances.

Capacity:

- It is expected with the proposed development in the area, transit scheduling would substantially change from existing, with a view to accommodating future ridership in the area.

Operations:

- Existing and proposed bus and streetcar stops in the vicinity are generally accompanied by a shelter;
- Streetcar services will generally operate within their own carriageway along Lake Shore Boulevard West in the vicinity of the Site. Bus services will continue to operate in mixed conditions;
- Streetcar tracks will be extended into the 2150 Lake Shore site; and
- The Park Lawn GO Station, streetcar services and Park Lawn Road bus services will all be integrated via the proposed mobility hub, allowing for seamless transfer between them.

6.4.2.3 Pedestrian

6.4.2.3.1 Overview

As outlined in Section 5.5.2.2.2, a number of pedestrian improvements are expected to be completed under the Near Term Horizon (2028), including sidewalks along Public Street A and the proposed 2150 Lake Shore development internal road network, upgrades to the existing sidewalks on Park Lawn Road, pedestrian plazas and streets providing key links to/from the Station and crossing opportunities across both Park Lawn Road and Lake Shore Boulevard. These improvements address key pedestrian accessibility considerations for the Station, by providing multiple access routes to/from the Station in all directions, including to/from the PUDO facilities and transit stops.

Building upon the above, in the Longer Term Horizon (2041), additional pedestrian infrastructure to be completed will further broaden pedestrian access opportunities to/from the Station and improve the pedestrian realm, most notably:

- Completion of the sidewalk upgrades along Park Lawn Road (between Public Street C and Lake Shore Boulevard West);

- Completion of the sidewalk network through the 2150 Lake Shore development;
- Sidewalk upgrades along Lake Shore Boulevard West; and
- Additional signalized crossing opportunities along Lake Shore Boulevard West.

As discussed in Section 6.4.1.2, the proposed GO Station is projected to generate in the order of 960 walking trips in the Longer Term Horizon (2041), with additional trips associated with walking to/from transit stops (480 trips), PUDO facilities (80 trips) and bicycle parking (80 trips). Overall, the above infrastructure is expected to provide adequate pedestrian access to the Station.

6.4.2.3.2 Longer Term Horizon (2041) Conditions Pedestrian Assessment

A qualitative review of the pedestrian infrastructure in the Longer Term Horizon (2041) has been undertaken in accordance with the review criteria outlined in Section 4.2.6.1.

Walking:

- The sidewalk along the east side of Park Lawn Road between Lake Shore Boulevard West and Public Street A will be upgraded and sidewalks along Lake Shore Boulevard West will upgraded.

Waiting/Crossing:

- Formal pedestrian crossings will be provided at existing and proposed signalized intersections; and
- Proposed signalized intersections will reduce distance between crossing points.

Connecting:

- Sidewalks are generally provided along both sides of Park Lawn Road and Lake Shore Boulevard West in the vicinity of the Site, with new pedestrian infrastructure proposed along Public Street A and within the 2150 Lake Shore site;
- The gap in the pedestrian network along the north side of Lake Shore Boulevard, east of The Marginal Boulevard will be closed with the upgrades to the sidewalks along Lake Shore Boulevard;
- Crossing opportunities will increase with the proposed signalized intersections; and
- The 2150 Lake Shore site will facilitate pedestrian movement with substantial internal pedestrian infrastructure proposed.

Accessible:

- Intersections in the vicinity of the Site generally accommodate all patrons regardless of age or ability.

6.4.2.4 Cycling

6.4.2.4.1 Overview

As outlined in Section 5.5.2.3.2, a number of bicycle network improvements are expected to be completed under the Near Term Horizon (2028), including the two-way cycle tracks along Park Lawn Road which will provide direct access to the proposed Station bicycle parking from Park Lawn Road.

Building upon the above, in the Longer Term Horizon (2041), the two-way cycle tracks along Park Lawn Road and along the 2150 Lake Shore development internal road network will be completed, in addition to the construction of bicycle lanes along both sides of Lake Shore Boulevard West and along the new north-south street and The Queensway as contemplated by the Park Lawn Lake Shore TMP, further improving bicycle access within the area.

As discussed in Section 6.4.1.2, the proposed GO Station is projected to generate in the order of 80 bicycle trips in the Longer Term Horizon (2041). Overall, the above infrastructure is expected to provide adequate bicycle access to the Station.

6.4.2.4.2 Longer Term Horizon (2041) Conditions Bicycle Assessment

A qualitative review of the bicycle infrastructure in the Longer Term Horizon (2041) has been undertaken in accordance with the review criteria outlined in Section 4.2.4.1.

Parking/Sharing:

- An existing Toronto Bike Share Station is located near the Site; and.
- Bicycle parking will be provided at the Park Lawn GO Station.

Connecting:

- The Site is located in close proximity to a number of existing off-road trails and recreational facilities, including the Humber Bay Park East Trail, the Humber Bay Shores Park, the Humber Bay Park East and West Parks and the Jean Augustine Park; and
- A two-way cycle track will be constructed along Park Lawn Road, providing a connection between the Station and the off-road trails to the south, whilst bicycle lanes will also be constructed along Lake Shore Boulevard West, the new north-south road, Legion Road, The Queensway and within the 2150 Lake Shore site.

Support:

- There is limited bicycle support facilities in the vicinity of the Site.

GO Station Facilities Review (Longer Term)

Building upon the GO Station facilities in the Near Term Horizon (2028), outlined in Section 5.6, this section provides an overview of the GO Station facilities in the Longer Term Horizon (2041), addressing vehicle PUDO access, transit access, bicycle access and pedestrian access to the Station.

6.4.3 Vehicular Pick-up / Drop-off Strategy

6.4.3.1 General Passenger / Vehicular Drop-Off

PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

6.4.3.2 Wheel-Trans / Para-Trans Facilities

Consistent with the Near Term Horizon (2028), a location for the staging of wheel-trans and other para-trans vehicles and an appropriate access path to the Station will be provided.

6.4.4 Transit Relationships / Integration

6.4.4.1 Surface Bus Routes

Consistent with the Near Term Horizon (2028), the 28 metre bus platforms along Park Lawn Road will continue to be in operation in the Longer Term Horizon (2041), continuing to allow for the services to remain “on-line” and minimize rerouting and delay in service times. As per the Near Term Horizon (2028), the Station bus stops will place bus passengers within close proximity of the Station and within a short walk to the many Station entrances.

6.4.4.2 TTC Streetcar

As part of the 2150 Lake Shore development, a new streetcar loop is proposed to provide immediate adjacency to the proposed new GO Station, compared with the current stops located approximately 350 metres to the south. The creation of an integrated transit hub provides a logical focus for new and existing area surface transit routes to converge as integrated feeder and distribution services to the GO rail service.

The 501 Queen and 508 Lake Shore streetcar services are planned to route to the new transit hub facility to provide the desired connectivity between these services and the tributary area these routes serve. The routes would be enhanced to maximize efficiency and service potential, with a dedicated right-of-way along Lake Shore Boulevard West through the Humber Bay Shores area, and a 3.5 metre-wide one-way dedicated facility along Public Street ‘B’ (Loop Road).

Two 30-metre long separate loading platforms at the Transit Hub will provide separated waiting areas for the planned 501B (westbound) service, and the 501A and 508B (eastbound) services. These platforms would be in parallel configuration. Two, separate unloading platforms and a layover space would allow for simultaneous boarding and alighting during peak times and help reduce passenger delay.

The streetcar platforms would be located approximately 50 metres from the upper level entrance to the GO Station building to facilitate a straightforward transfer between services.

The configuration of the streetcar platforms are shown in Figure 6-7.

6.4.5 Pedestrian Facilities

6.4.5.1 Connected to the Wider Community

As outlined in Section 5.6.3, high quality pedestrian spaces and facilities, such as Station Square, the pedestrian street off Park Lawn Road and a widened pedestrian boulevard along Park Lawn Road will be completed within the Near Term Horizon (2028) and these will continue to provide the initial pedestrian connections from the Park Lawn bus platforms to the upper level of the GO station building entrance and streetcar platforms.

As previously shown in Figure 6-3, in the Longer Term Horizon (2041), additional pedestrian routes through the planned 2150 Lake Shore development and along the completed Public Street 'B' (Loop Road) will improve connectivity to the Humber Bay Shores community. These two new routes provide contrasting pedestrian experiences for persons walking to / from the GO Station. Wide public pedestrian sidewalks along Public Street 'B' (Loop Road) will provide ample space for persons who are walking to / from the proposed GO Station, whilst additional public spaces will provide enlargements to the public realm between the public right-of-way of Public Street 'B' (Loop Road) and the adjacent building faces. The covered Galleria route, offers an urban, and lively route, with retail and commercial spaces flanking the pedestrian space.

The network of pedestrian spaces and routes proposed as part of the 2150 Lake Shore development provide the residents of the Humber Bay Shores community a variety of high-quality pedestrian routes to access the proposed GO Station. Improving these facilities will help encourage the use of transit infrastructure as a viable, safe, and convenient means of travel.

6.4.6 Cycling Facilities

6.4.6.1 Cycling Network and Access Routing

As per the Near Term Horizon (2028), a two-way cycle track (minimum 3 metres wide) is being proposed on the east side of Park Lawn Road between Lake Shore Boulevard West and Public Street A as part of the 2150 Lake Shore development, which will be completed for the Longer Term Horizon (2041), as previously shown in Figure 6-4. The cycle track will provide a connection for area residents to access the lower level of the proposed Station building, where secured bicycle parking facilities are being planned.

In addition to the Park Lawn cycle track, a two-way cycle track is being planned on the outside of Public Street B (Loop Road). This facility will provide connections between the new cycle tracks on Lake Shore Boulevard West and Station Square.

6.4.6.2 Bicycle Parking Facilities

Station bicycle parking facilities in the Longer Term Horizon (2041) will remain consistent with the Near Term Horizon (2028), which at this time is:

- A minimum of 192 covered bicycle parking spaces to be provided within the Station precinct at-grade in highly visible, key locations relative to the proposed GO station

entrances. Further coordination with the landscape design is required to determine their exact locations; and

- A minimum of 96 secured bicycle parking spaces to be integrated into the basement of the 2150 Lake Shore development and accessed from the two-way cycle track on Park Lawn Road.

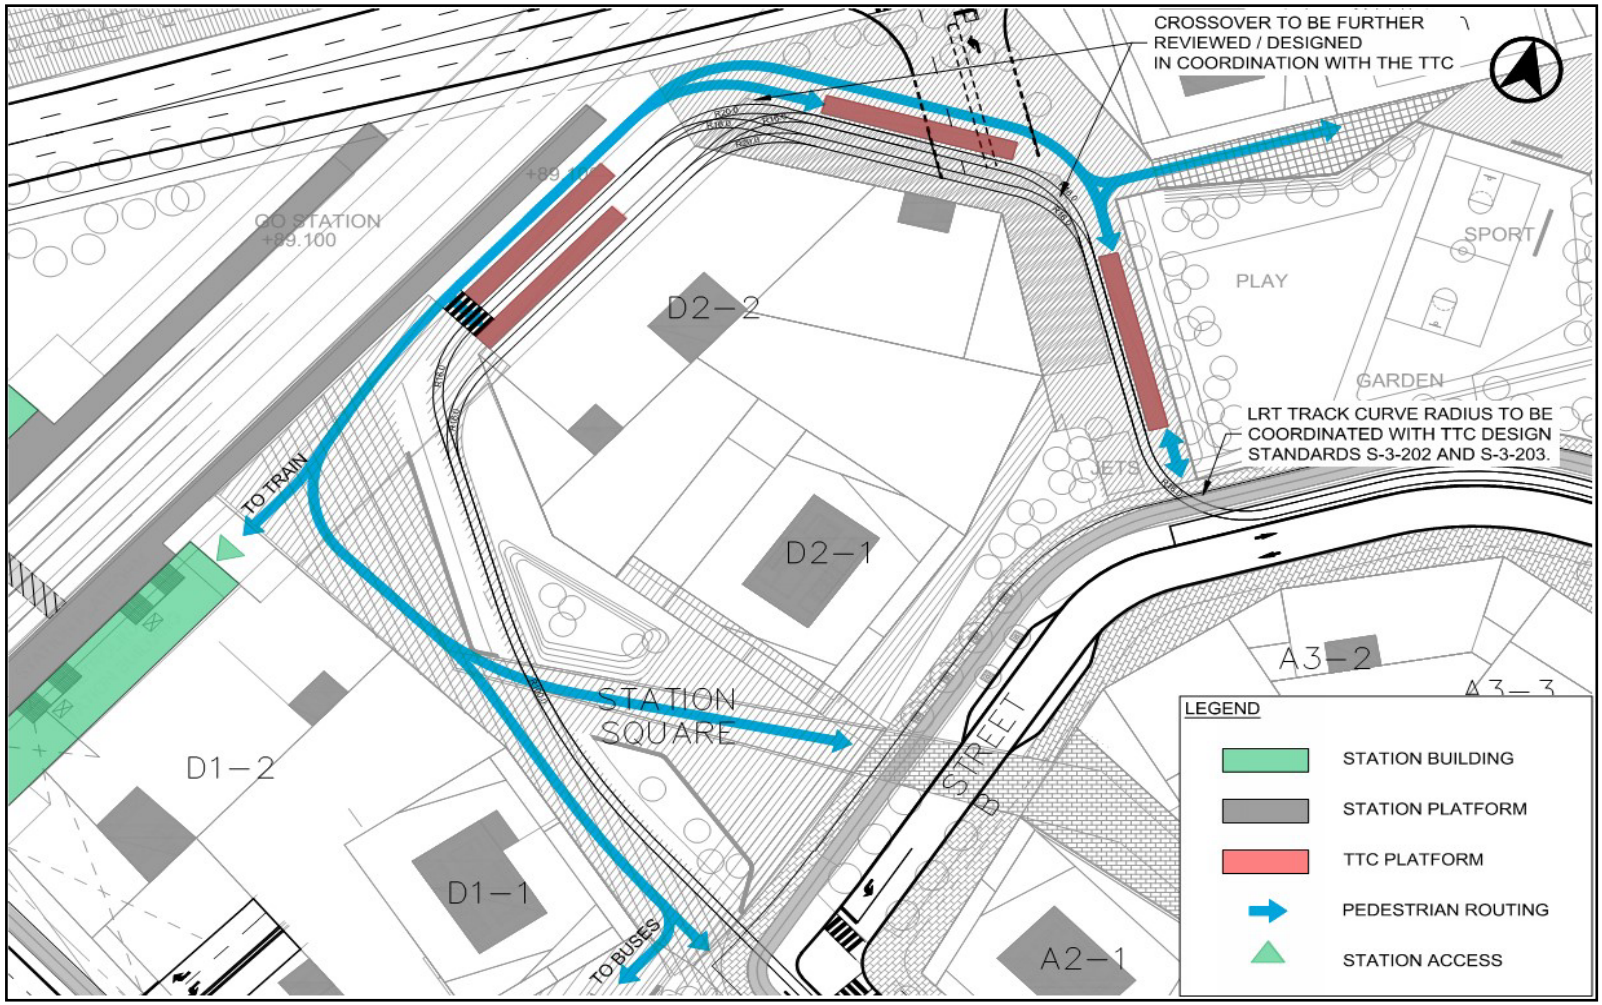

Figure 6-7: Longer Term Horizon (2041) Configuration of Proposed Streetcar Platforms

7. Physical Plan and Construction Review

7.1 Construction Conditions Review

Construction of the proposed Park Lawn GO Station will feature various independent elements, including the north station building, the south station building, a tunnel connecting the two station buildings, the Park Lawn rail bridge widening, and a pavilion with elevator and stairs north of the rail corridor and a sloped walkway south of the rail corridor, both west of Park Lawn Road. As the location of these elements feature different geographical constraints, site access for each will have different impacts to surrounding pedestrian, cyclist, vehicular, and rail traffic:

- To construct the tunnel connecting the north and south station buildings beneath the rail corridor, crews will access the site from the north City lands and occupy the rail corridor over a weekend closure. This closure will be arranged with Metrolinx and will allow the crews to cut the tracks, excavate to grade, install the tunnel segments, waterproof, and replace the materials and track above. Prior to re-opening the track at the end of the weekend closure, crews will ensure that the replacement of the sub-ballast, ballast, and tracks meet Metrolinx requirements and does not impact the resumption of train service or rail operations.
- The south station building site will be constructed within the Developer's land south of the rail corridor, with the lands being accessed from either Park Lawn Road or Lake Shore Boulevard. As access gates for the site already exist on these streets at signalized intersections, impacts to pedestrians and vehicles should be limited during construction.
- The north station building will be constructed within the City lands north of the rail corridor, which are currently inaccessible by road. As such, in order to construct this station the project team will need to concurrently complete the excavation works for the proposed Public Street A within those lands, thereby creating an access to the site off of Park Lawn Road. While the site access is being excavated at Park Lawn Road, space will be required on Park Lawn Road and the sidewalk in order to work safely. Once this access is created, crews will use this access point on Park Lawn Road for the construction of the north station building.
- The rail bridge crossing Park Lawn Road will need to be widened to accommodate the future station platform. As this work will occur adjacent to live tracks and above Park Lawn Road, construction will be coordinated so as to minimize impacts to vehicular, pedestrian, and rail traffic. The project team will access the site from Park Lawn Road and use rail and lane closures, traffic control devices, and flag persons as necessary to minimize impacts on the travelling public.
- Both the pavilion with elevator and stairs north of the rail corridor and the sloped walkway south of the rail corridor, both west of Park Lawn are intended to be constructed with site access from Park Lawn Road. Crews will shift the traffic lanes on Park Lawn Road to maintain two lanes of traffic in each direction, and use jersey barriers to delineate the work site from the traffic lanes.

Throughout all stages of construction, the project team will be committed to reducing impacts on the pedestrian, cyclist, vehicular, and rail traffic. This includes but is not limited to implementing traffic control plans, utilizing traffic control devices, undertaking public information campaigns, developing worker safety plans, and continuous monitoring and review of these elements.

8. Conclusion and Findings

Study Overview

1. This Transportation Brief has been prepared to document the Existing Conditions, and assess the potential effects of the new GO Station on the area transportation networks.
2. The Park Lawn GO Station will be located on both sides of the Lakeshore West rail corridor, and provide a stop between Mimico GO Station and Exhibition GO Station. It will be located at the north end of the former Mr. Christie Cookie factory, which is located 100 metres south of the Gardiner Expressway, on both sides of Park Lawn Road, and 300 metres northwest of Lake Shore Boulevard West, within the City of Toronto.
3. Park Lawn GO Station will include a fully accessible station building with platform access points, tunnel infrastructure, multimodal access, bicycle parking and connections with local transit.
4. The Station is planned as an urban station serving large surrounding existing and planned populations, and is premised largely on walk-in and transit trips to and from the Station. No commuter parking is proposed, however PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

Existing Transportation Conditions

5. Traffic operations analysis results for Existing Conditions indicate that the area road network is currently operating within theoretical capacity, albeit a number of intersections/movements are in high demand.
6. The Site area currently has reasonable access to TTC streetcar and bus services, but limited access to higher order rail service. Utilization of the TTC transit services vary, with the streetcar services in the highest demand.
7. Pedestrian infrastructure in the area includes sidewalks along both sides of key roads in the area, with signalized intersections providing crossing opportunities. However, mid-block connections are limited, whilst the 2150 Lake Shore site is currently a large impermeable block which prevents through connections.
8. Bicycle infrastructure in the area includes a number of off-road trails such as the Martin Goodman Trail, however on-road facilities are limited.

Near Term Horizon (2028) Transportation Conditions

9. Under the Near Term Horizon (2028), the Station is projected to generate peak hour ridership in the order of 1,050. For travel to/from the Station, the projected ridership is

projected to result in the order of 315 local transit trips, 630 walking trips, 50 bicycle trips and 55 PUDO trips (110 two-way vehicle trips).

10. Key transportation network improvements which are being contemplated by other area studies and are assumed to be in place for the Near Term Horizon (2028), include:
    - Construction of Public Street A between Park Lawn Road and Lake Shore Boulevard West;
    - Partial construction of the 2150 Lake Shore development internal road network;
    - Construction of the Legion Road extension;
    - Intersection improvements proposed as part of other area studies, necessary to support the projected future background traffic;
    - Construction of bus stops adjacent the Station, with additional bus services (bus route 80) to be rerouted to the Site area; and
    - Construction of new and upgraded active transportation infrastructure along Park Lawn Road, Public Street A and through the partially constructed 2150 Lake Shore development internal road network, providing multiple access routes to/from the Station.
11. With the road network improvements which are assumed to be in place for the Near Term Horizon (2028), it is projected that future traffic can generally be adequately accommodated, albeit some capacity constraints are projected within the area under Future Background conditions. As previously discussed, the Park Lawn Lake Shore TMP is reviewing the long term transportation needs in the area. As the context of the area continues to evolve and proposed road, transit and active transportation infrastructure comes online, mode shifts, volumes and operations can be expected to continue to adjust, as is being addressed by the Park Lawn Lake Shore TMP. The number of vehicle trips projected to be generated by the Station itself (110 two-way trips) is relatively low and subsequently, the impact of the proposed Station on the surrounding road network is expected to be minimal. No additional mitigation measures are recommended.
12. The transit and active transportation improvements being contemplated by other area studies which are assumed to be in place for the Near Term Horizon (2028) are expected to provide adequate transit, pedestrian and bicycle access to the Station.

Near Term Horizon (2028) Transportation Facilities

13. PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

14. Pedestrian entrances to the Station are proposed to include an entrance from Station Square at the upper level of the Station building, entrances to the lower level of the Station on the north side of the rail corridor (accessible from Public Street A), and an entrance on the east side of Park Lawn Road, just south of the rail corridor. Secondary accesses to the rail platforms are proposed to be provided on the north and south side of the rail corridor, on the west side of Park Lawn Road.

15. At this time, a minimum of 192 covered bicycle parking spaces (generally located at-grade) are to be provided within the Station precinct. An additional minimum of 96 secured bicycle parking spaces will be integrated into the 2150 Lake Shore development and accessed from the proposed cycle track on Park Lawn Road.

Longer Term Horizon (2041) Transportation Conditions

16. Under the Longer Term Horizon (2041), the Station is projected to generate peak hour ridership in the order of 1,600. For travel to/from the Station, the projected ridership is projected to result in the order of 480 local transit trips, 960 walking trips, 80 bicycle trips and 80 PUDO trips (160 two-way vehicle trips).

17. Key additional transportation network improvements which are being contemplated by other area studies and are assumed to be in place for the Longer Term Horizon (2041), include:

    - Completion of the 2150 Lake Shore development internal road network;
    - Construction of a new north-south road extending from the Lake Shore Boulevard West / Brookers Lane intersection to The Queensway. The Gardiner Expressway ramps which currently connect to Lake Shore Boulevard West are proposed to be realigned to connect to this new north-south street.
    - Additional intersection and road improvements proposed as part of other area studies;
    - Construction of streetcar stops adjacent the Station and streetcar tracks alongside Public Street B (Loop Road) within the 2150 Lake Shore development; and
    - Additional new and upgraded active transportation infrastructure along Park Lawn Road and Lake Shore Boulevard West, the new north-south street, The Queensway and through the completed 2150 Lake Shore development internal road network.

18. A detailed review of the Longer Term Horizon (2041) is being undertaken through other ongoing area studies, in particular the Park Lawn Lake Shore TMP and the Christie's Planning Study.

19. However in a general sense, vehicle trips associated with the Station are projected to be minimal, in the order of 80 PUDO trips (160 two-way vehicle trips), and are not expected to have a significant impact on the operation of the surrounding road network.

20. Furthermore, the Station itself will significantly influence travel patterns in the area and on a broader scale, is expected to reduce vehicle trips generally in the area.

21. The infrastructure transit and active transportation improvements being contemplated by other area studies are expected to provide adequate transit, pedestrian and bicycle access to the Station in the Longer Term Horizon (2041).

Longer Term Horizon (2041) Transportation Facilities

22. PUDO is currently contemplated along Public Street A for accessible PUDO (paratransit/TTC WheelTrans facilities) and within the 2150 Lake Shore development for general PUDO. The implementation of the permanent general PUDO will be coordinated with the phasing of the 2150 Development and monitoring of usage shall be conducted as part of Metrolinx' ridership monitoring program.

23. Pedestrian entrances and bicycle parking facilities in the Longer Term Horizon (2041) will remain consistent with the Near Term Horizon (2028).

Construction Conditions

24. Construction of the proposed Park Lawn GO Station will feature various independent elements, including the north station building, the south station building, a tunnel connecting the two station buildings, the Park Lawn rail bridge widening, and the north pavilion and south walkway, west of Park Lawn Road.

25. Throughout all stages of construction, the project team will be committed to reducing impacts on the pedestrian, cyclist, vehicular, and rail traffic. This includes but is not limited to implementing traffic control plans, utilizing traffic control devices, undertaking public information campaigns, developing worker safety plans, and continuous monitoring and review of these elements.

Schematic of TSP Loops and TSP Runs (N.T.S)

Notes:

SRM channels #1 and #2 also each place a call (via separate detector cards) to call and extend phase 5

Pins from SRM removed to avoid false calls during temporary operation in effect

2.1.9.2 Advanced I/O Scripts:

Input Script 4 "Copy Det To TSP" must be enabled

Copies Detector 5 and 7 calls to TSP inputs 3 and 7 respectively.

Phase 6 is allowed to "back-up" to phase 5 in the absence of side street demand. (WBLT is prohibited to avoid the "Yellow Trap.")

EBG/EWDW or EBG/EWFD (South side only)	0 - 18	0 - 18	0 - 18	0 - 18	0 - 18
EBY/EWDW	3	3	3	3	3
ALLR	2	2	2	2	2
Cycle Length/Range	104	88	88	88-104	88

NOTES:
Hardwire connection to EB Gardiner Off-Ramp & Legion Rd North (TCS2040) to provide coordination all times. The hardwire interconnect provides simultaneous EBY at both signals at all times.
This intersection is the master signal of TCS2040.
EBG phase is callable by vehicle or pedestrian actuation. If a vehicle call is received, the minimum EBG is 7 secs. If there is on-going EB vehicle demand, the EBG can extend up to a maximum 25. If a pedestrian call is received, Pedestrian minimum will be served.
The EWWK & EWFD are only displayed on the pedestrian signal heads if a pedestrian call is received.
NSFD reverts to NSWK if there is no side street vehicle demand at the end of NSFD.

Cycle Length /Range	88	88	88	88-104	88

NOTES:

***** NBLA is callable by setback loop 24 hours daily. Unused time allocated to NSG/NSWK.

** WB phase is callable by vehicle and/or pedestrian actuation. If a vehicle call is received, the minimum WBG is 7 seconds.If ongoing vehicle demand exists on the stop-bar loop, the WBG is capable of providing vehicle extensions up to a maximum of 26 secs. If a pedestrian call is received, the minimum WBG is 26 seconds. The EWWK & EWFD are only displayed on the pedestrian signal heads if a pedestrian call is received. Unused time allocated to NSG.

SCOOT cycle lengths between 32-64 may change by 4 second increments, between 64-128 by 8 second increments and above 128 by 16 second increments. SCOOT may change the cycle length by one increment at a time every 150 seconds.

Intersection Summary
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
#~ 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m# Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

1. Mobility Assumptions

1.1 Approach

Future travel patterns for the planned and committed developments adopted as background developments in the Near Term Horizon (2028) have been reviewed on the basis of the implementation of assumed Near Term transportation infrastructure, including the Park Lawn GO Station.

Mobility characteristics were reviewed by land use. As such, the approach taken to understand and estimate the shift in travel patterns is as follows:

- Review of existing **Residential Travel** characteristics, including distribution and mode share; review the transit investments with respect to travel locations and draw comparisons, for application to the proposed background development residential. Separate characteristics and comparisons were reviewed and determined based on the development location as follows:
    - Travel characteristics associated with the proposed background development residential in the Site area were reviewed and determined, represented by existing travel characteristics for TTS zone 285 and herein referred to as “Local Residential”. These characteristics were applied to the background development residential proposed as part of the 2150 Lake Shore Boulevard West, Humber Bay Shores and 42 Park Lawn Road developments; and
    - Travel characteristics were also reviewed and determined for the proposed background development residential which are peripheral to the Site area but are still expected to be impacted from a mobility perspective by the delivery of the transportation infrastructure. These developments are located generally to the west of the Park Lawn Road corridor, represented by existing travel characteristics for TTS zones 286, 287, and 288 and are herein referred to as “Peripheral Residential”. These characteristics were applied to background development residential proposed as part of the Mimico-Judson, 2313 Lake Shore Boulevard West and 251 Manitoba Street developments.
- Review of **Office Travel** characteristics for comparable sites, including distribution and mode share; review the transit investments with respect to travel locations and draw comparisons, for application to the proposed background development office. Similar to the residential, separate characteristics were determined based on the development location as follows:
    - Travel characteristics associated with the proposed background development office in the Site area were determined, (represented by TTS zone 285), herein referred to as “Local Office”. These characteristics were applied to the background development office proposed as part of the 2150 Lake Shore Boulevard West development; and

  - Travel characteristics were also determined for the proposed background development office which are peripheral to the Site area but are still expected to be impacted from a mobility perspective by the delivery of the transportation infrastructure (represented by TTS zones 286, 287 and 288), herein referred to as “Peripheral Office”. These characteristics were applied to background development office proposed as part of the Mimico-Judson development.

- Review of **Retail Travel** characteristics for comparable sites, including distribution and mode share; review the transit investments with respect to travel locations and draw comparisons, for application to the proposed background development retail.

The background developments are shown graphically in Figure 1-1.

Travel distribution has been aggregated into locations of Toronto and the Greater Toronto Area (GTA) based primarily on transit access. The distribution zones are reviewed in Section 1.2.

The approach taken to understand and estimate the shift in travel patterns is a review of existing distribution and mode share to and from the different GTA locations, planned transit and transportation infrastructure for the area, and estimating how this will impact travel characteristics. The changing transportation infrastructure and sample travel times are reviewed in Section 1.3.

For travel to particular areas of the City and Region, proxy comparisons to other comparable sites are utilized for estimation purposes.

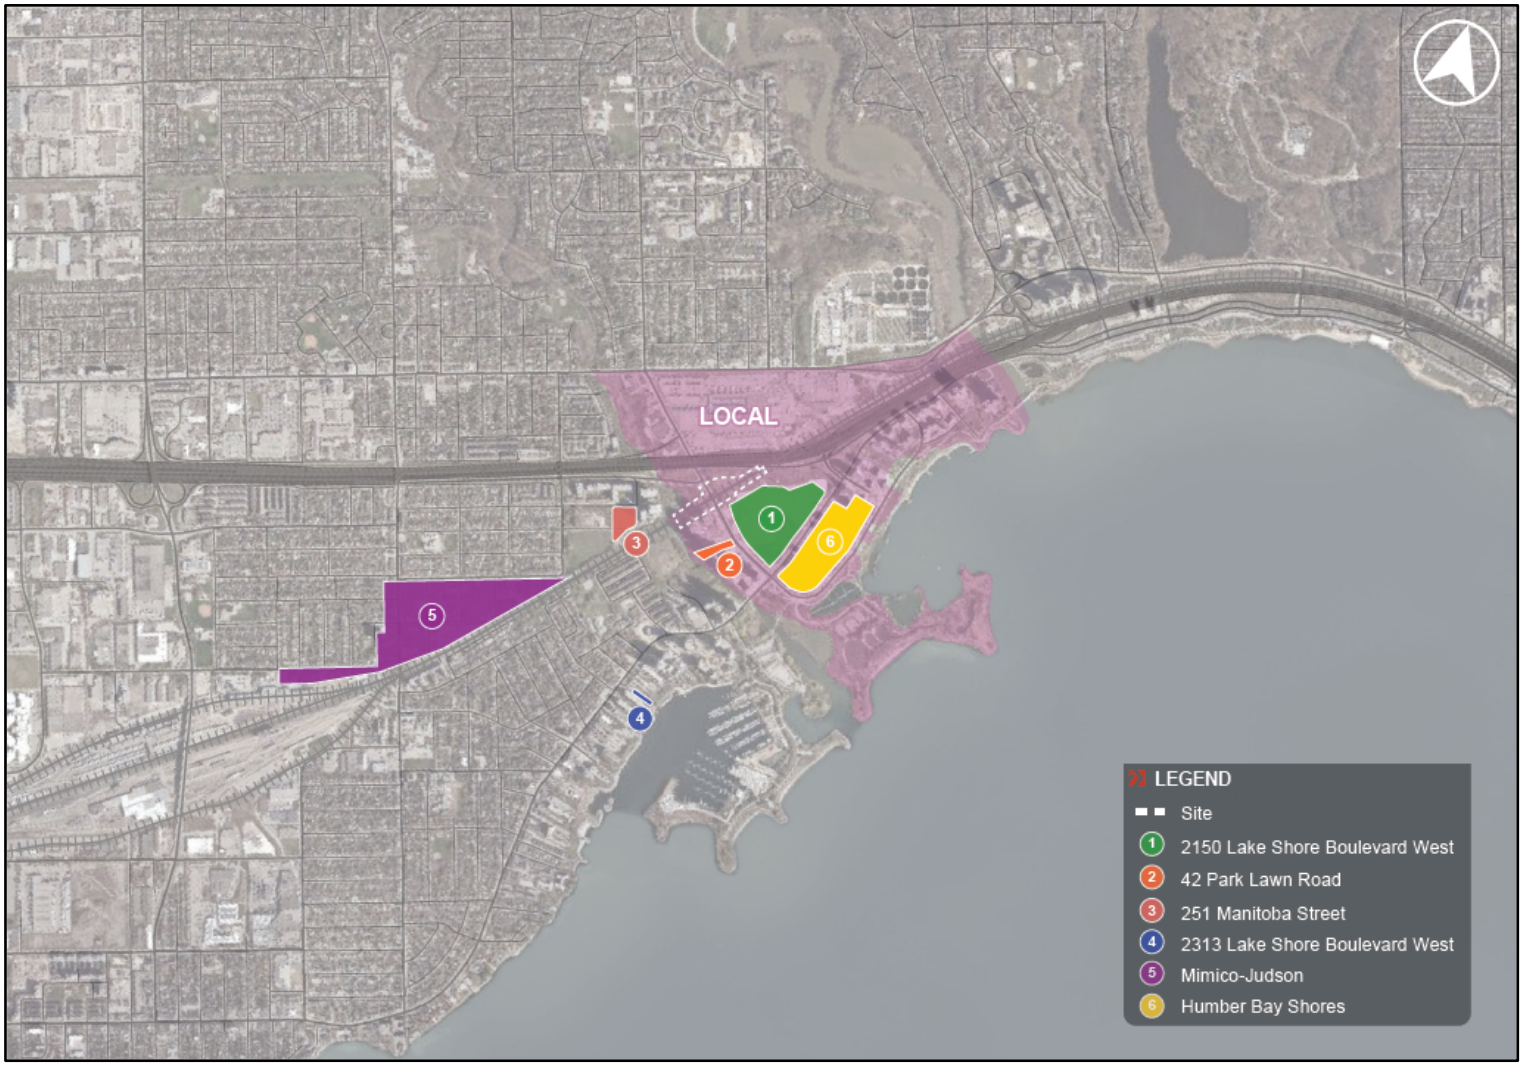

Figure 1-1: Assumed Background Developments

1.2 Travel Distribution Zones

For the purpose of trip distribution, a number of key travel zones were identified with respect to expected travel patterns. The distribution zones are listed and described below and are shown graphically in Figure 1-2.

Downtown Toronto Central refers generally to the areas of Toronto between the rail line just north of Dupont Street to the north, Parliament Street to the east and Bathurst Street to the west.

Downtown Toronto West refers generally to the areas of Toronto between the rail line just north of Dupont Street and Dundas Street West to the north, Bathurst Street to the east and the Humber River to the west.

Downtown Toronto East refers generally to the areas of Toronto between Don Valley Parkway and Massey Creek to the north, Victoria Park Avenue to the east and Parliament Street to the west.

Midtown Toronto refers generally to the areas of Toronto between Lawrence Avenue to the north, the rail line just north of Dupont Street to the south, Bayview Avenue to the east and the Humber River to the west.

Yonge-University Corridor refers generally to the areas of Toronto beyond the aforementioned Downtown and Midtown zones which are well serviced by the Yonge-University Subway. This generally includes the area between Steeles Avenue to the north, Lawrence Avenue to the south, Bayview Avenue to the east and the Black Creek to the west.

GTAA / West GO Corridors refers to the employment areas around Toronto Pearson Airport within Etobicoke, Mississauga and Brampton (generally between Rexdale Boulevard, Highway 427 and Queen Street to the north, Eglinton Avenue and Highway 401 to the south, Islington Avenue to the east and Highway 410 to the west), as well as areas around GO Stations on the Kitchener, Milton and Lakeshore West GO Train Lines.

South Etobicoke refers generally to the areas of Etobicoke south of Bloor Street and Dundas Street. It also generally refers to areas of Mississauga south of Highway 403.

Central Etobicoke refers generally to the areas of Etobicoke generally between Highway 401 to the north and Bloor Street and Dundas Street to the south.

Local refers to the immediate Site area (i.e. TTS Zone 285).

Toronto East refers to areas of eastern Toronto which are not included in the aforementioned areas, including Scarborough.

North East refers to cities to the north and east of Toronto (east of Highway 50), including Vaughan, Richmond Hill and Markham.

North West refers to the northwest areas of Toronto and areas of other cities to the north and west of Toronto (west of Highway 50) which are not included in the aforementioned areas, including Brampton and Mississauga.

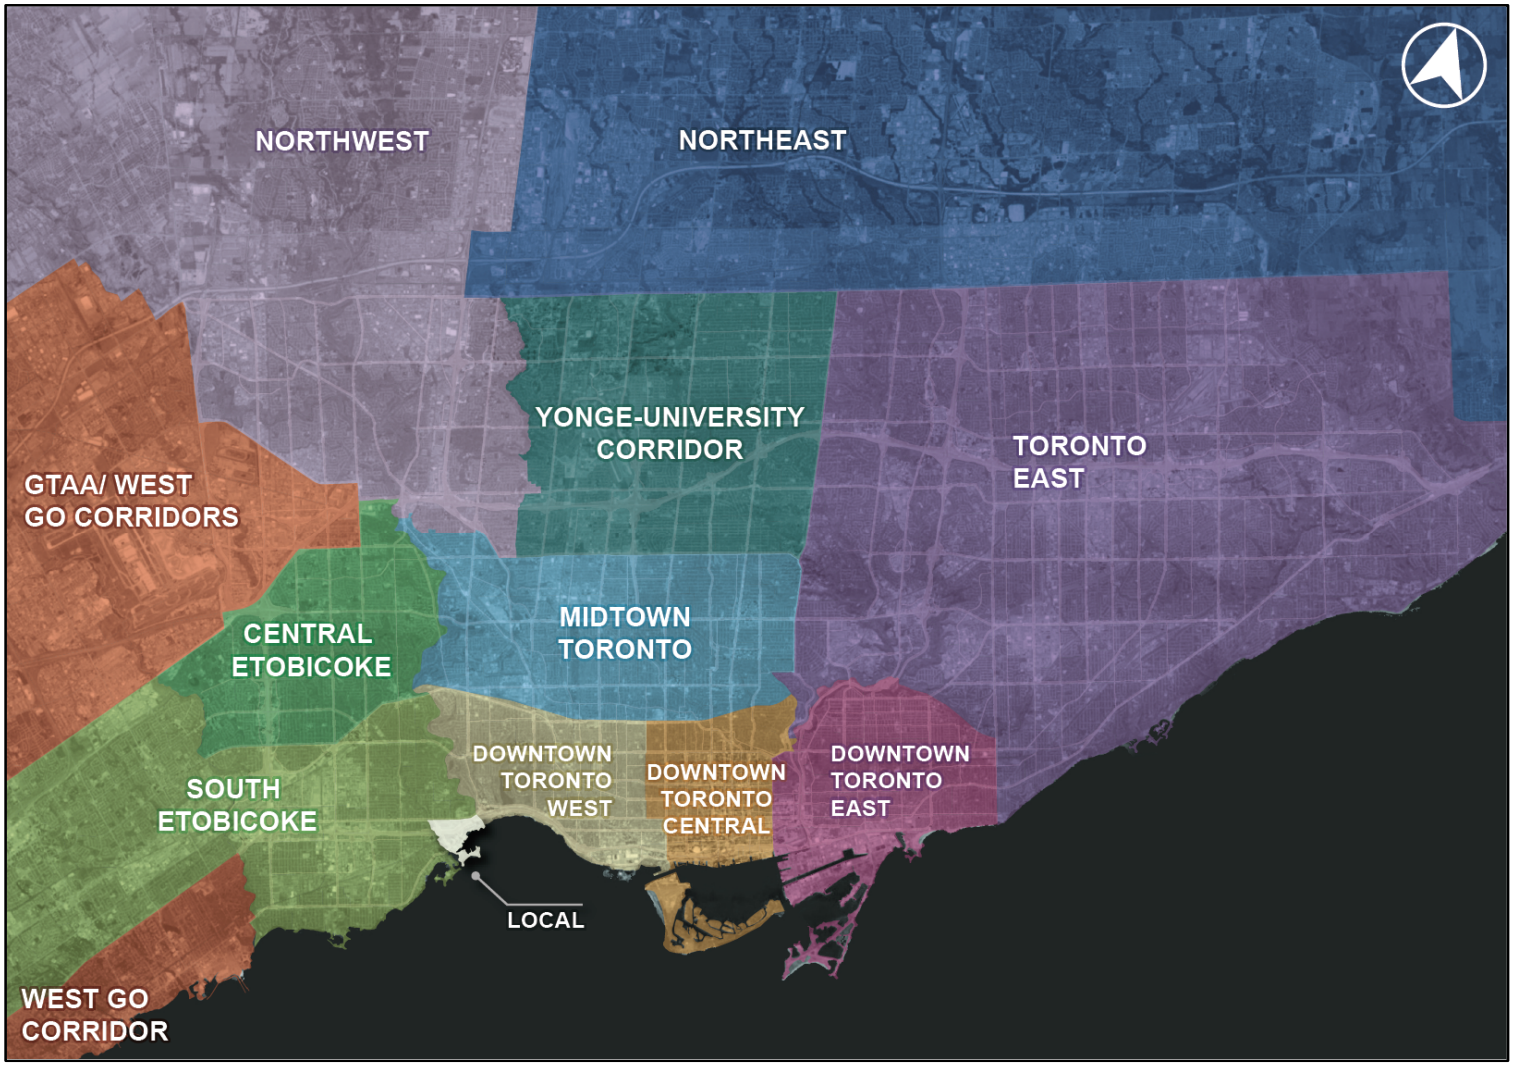

Figure 1-2: Travel Distribution Zones

1.3 Major Transportation Network Changes

The existing transportation context of the Site area has the following existing major key elements:

Transit

- Lakeshore West – Mimico GO Station
- TTC 501 Queen and 508 Lake Shore Streetcars
- TTC Bloor Line 2 Subway
- Surface Bus Routes

Road

- Gardiner Expressway
- Lake Shore Boulevard West
- Park Lawn Road
- The Queensway

Active

- Martin Goodman Trail
- Mimico Creek Path

The assumed Near Term (2028) transportation context of the Site area, has the following key elements and improvements:

- Construction of the Park Lawn GO Station;
- Waterfront Transit Reset, which proposes improvements to the streetcar routes, including construction of a new LRT right-of-way along segments of the route to the east and improvements to mixed traffic streetcar operations along other segments of the route to the west; and
- Construction of a key new road connection (Public Street 'A' (Relief Road)), which will extend from Park Lawn Road at the Gardiner Expressway Eastbound Off Ramp to Lake Shore Boulevard West at The Marginal Boulevard, thereby alleviating pressure on Park Lawn Road and Lake Shore Boulevard West.

It is noted that the new GO Station is expected to substantially improve travel times to various parts of Toronto and the GTA. Examples of such improvements are outlined in Table 1-1, whilst the key transportation elements and the distance to transit access are highlighted in Figure 1-3.

The next sections break out the key distribution zones to discuss future distribution and mode share characteristics for travel to each zone.

Table 1-1 Estimated Travel Times

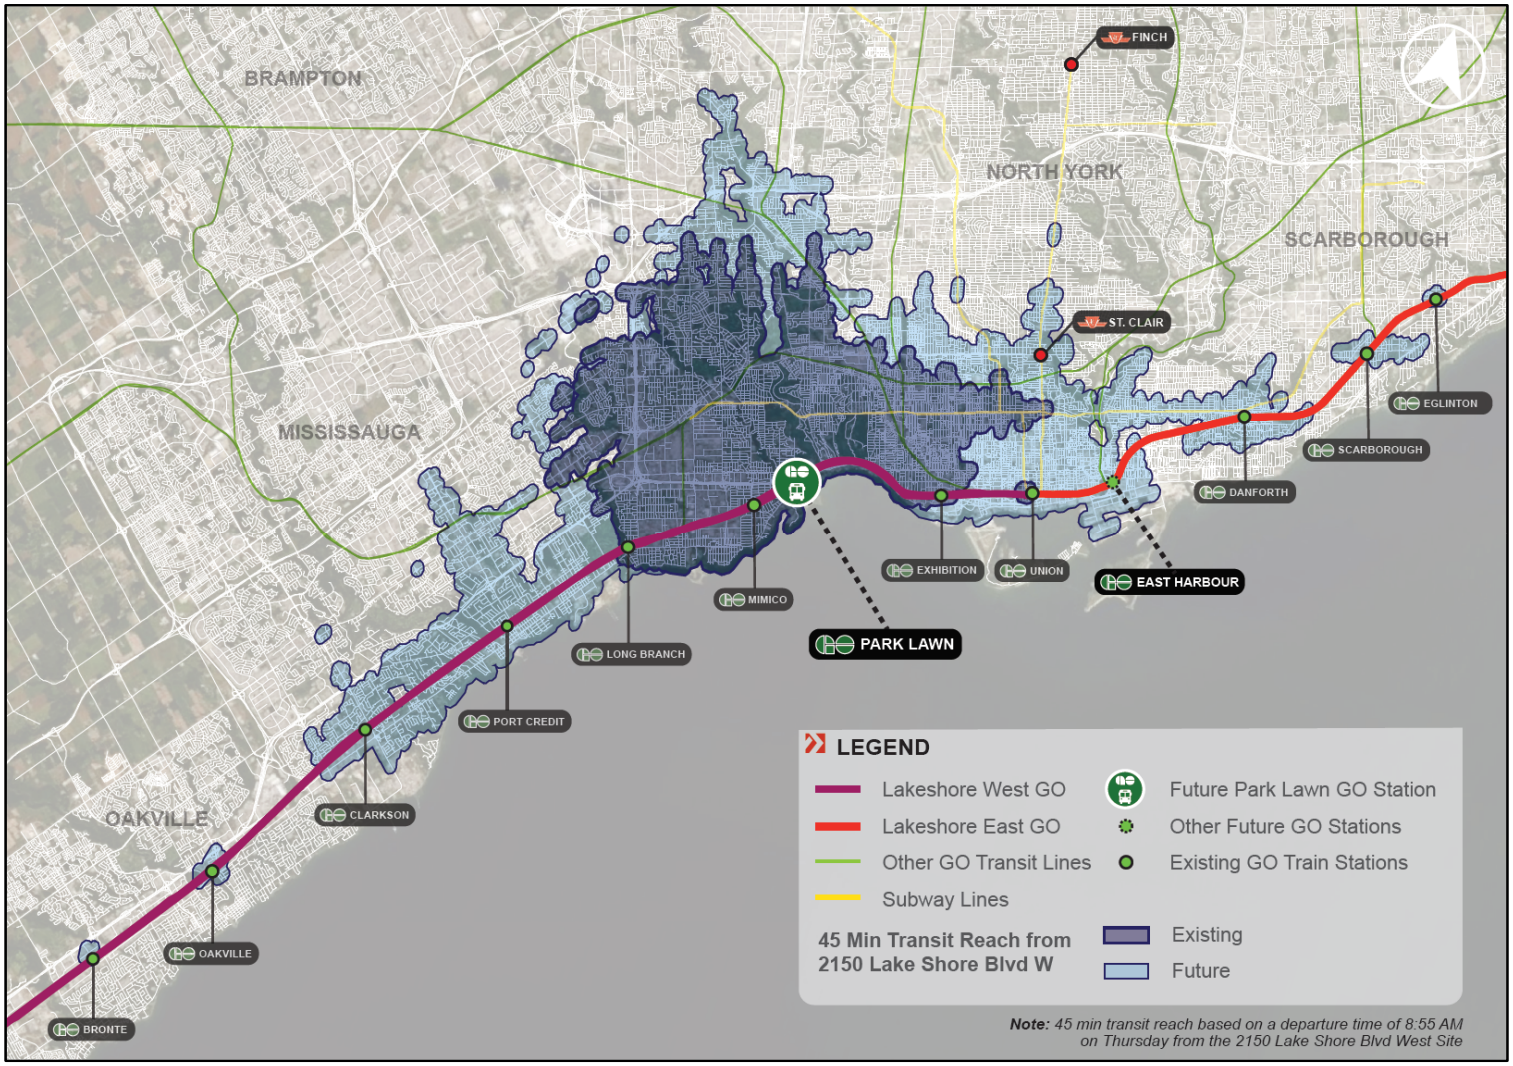

Figure 1-3: Evolving Transportation Context

1.4 Mobility Considerations

1.4.1 Residential Travel

1.4.1.1 Existing Characteristics

The existing distribution by location for residential travel is summarized in Table 1-2 and Table 1-3 for Local Residential and Peripheral Residential respectively and shown graphically in Figure 1-4 and Figure 1-5 respectively.

Currently, the majority of residential trips are made either to / from the Downtown Toronto and South Etobicoke distribution zones. It is also noted that transit use is much higher for distribution zones within Toronto, compared with distribution zones outside of Toronto, primarily due to the increased availability of transit services.

Table 1-2 Existing Local Residential Mobility Profile

Distribution Zone		% Dist.	Transit Local	Transit GO	Active	Auto	Passenger	PuDo
Downtown Toronto	Central	32%	56%	3%	5%	32%	3%	1%

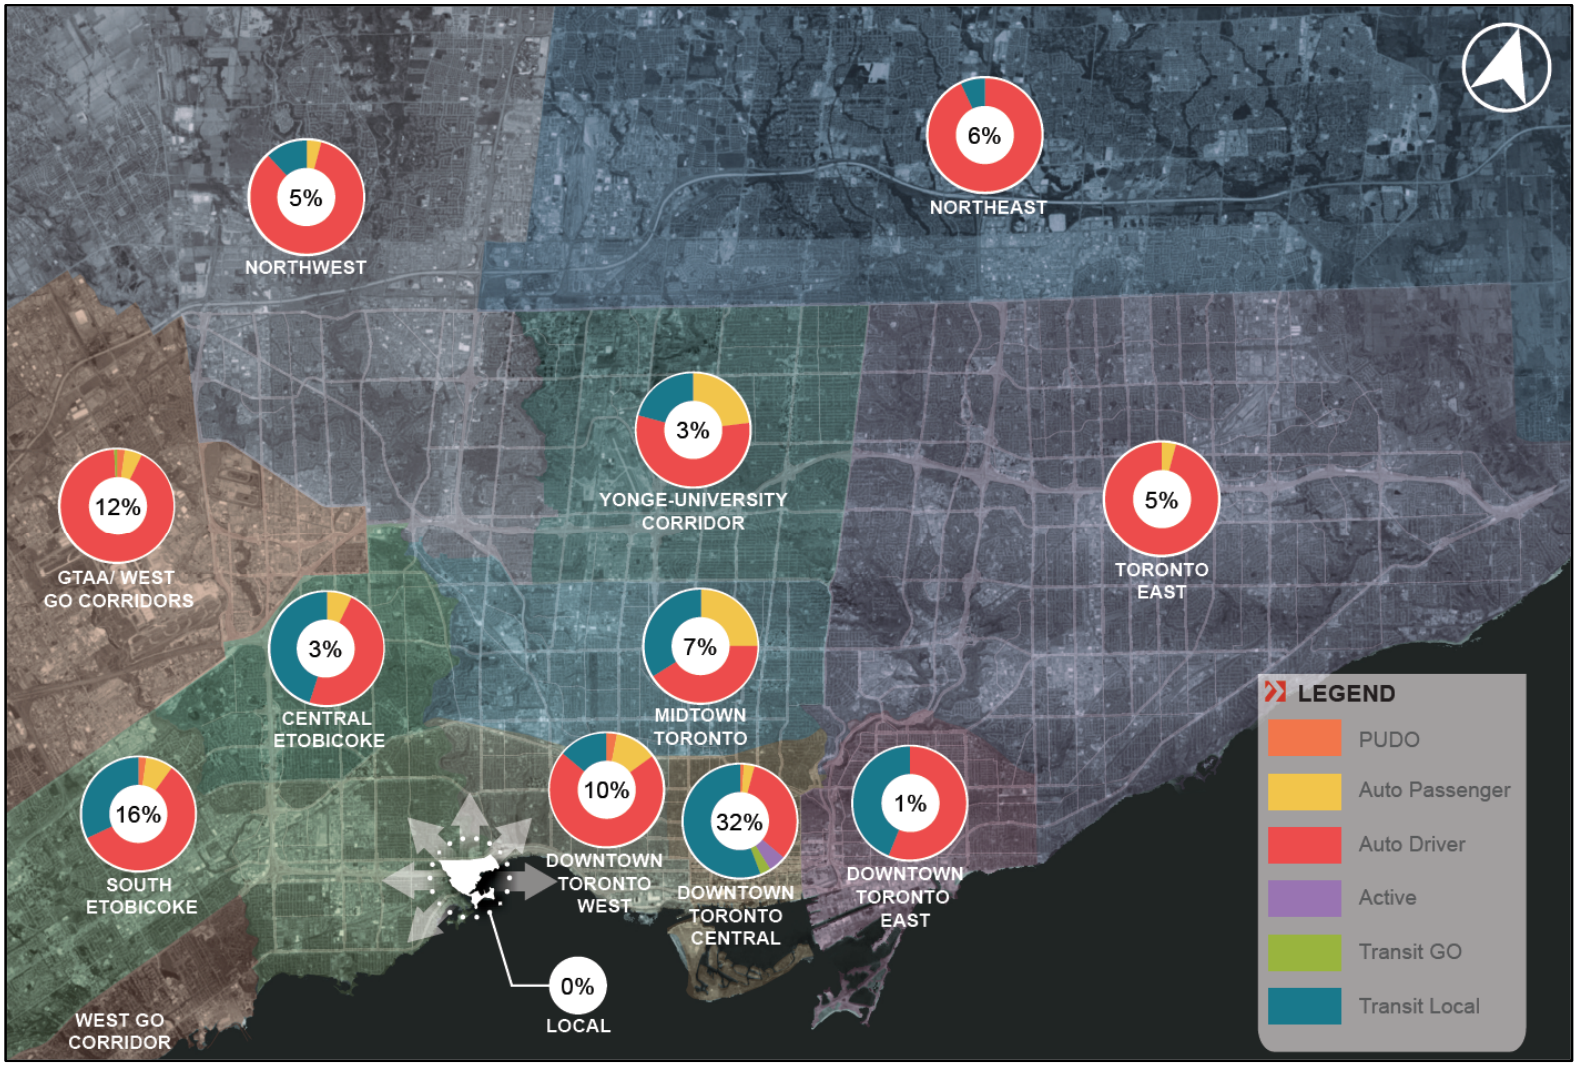

Figure 1-4: Existing Local Residential Distribution by Mode

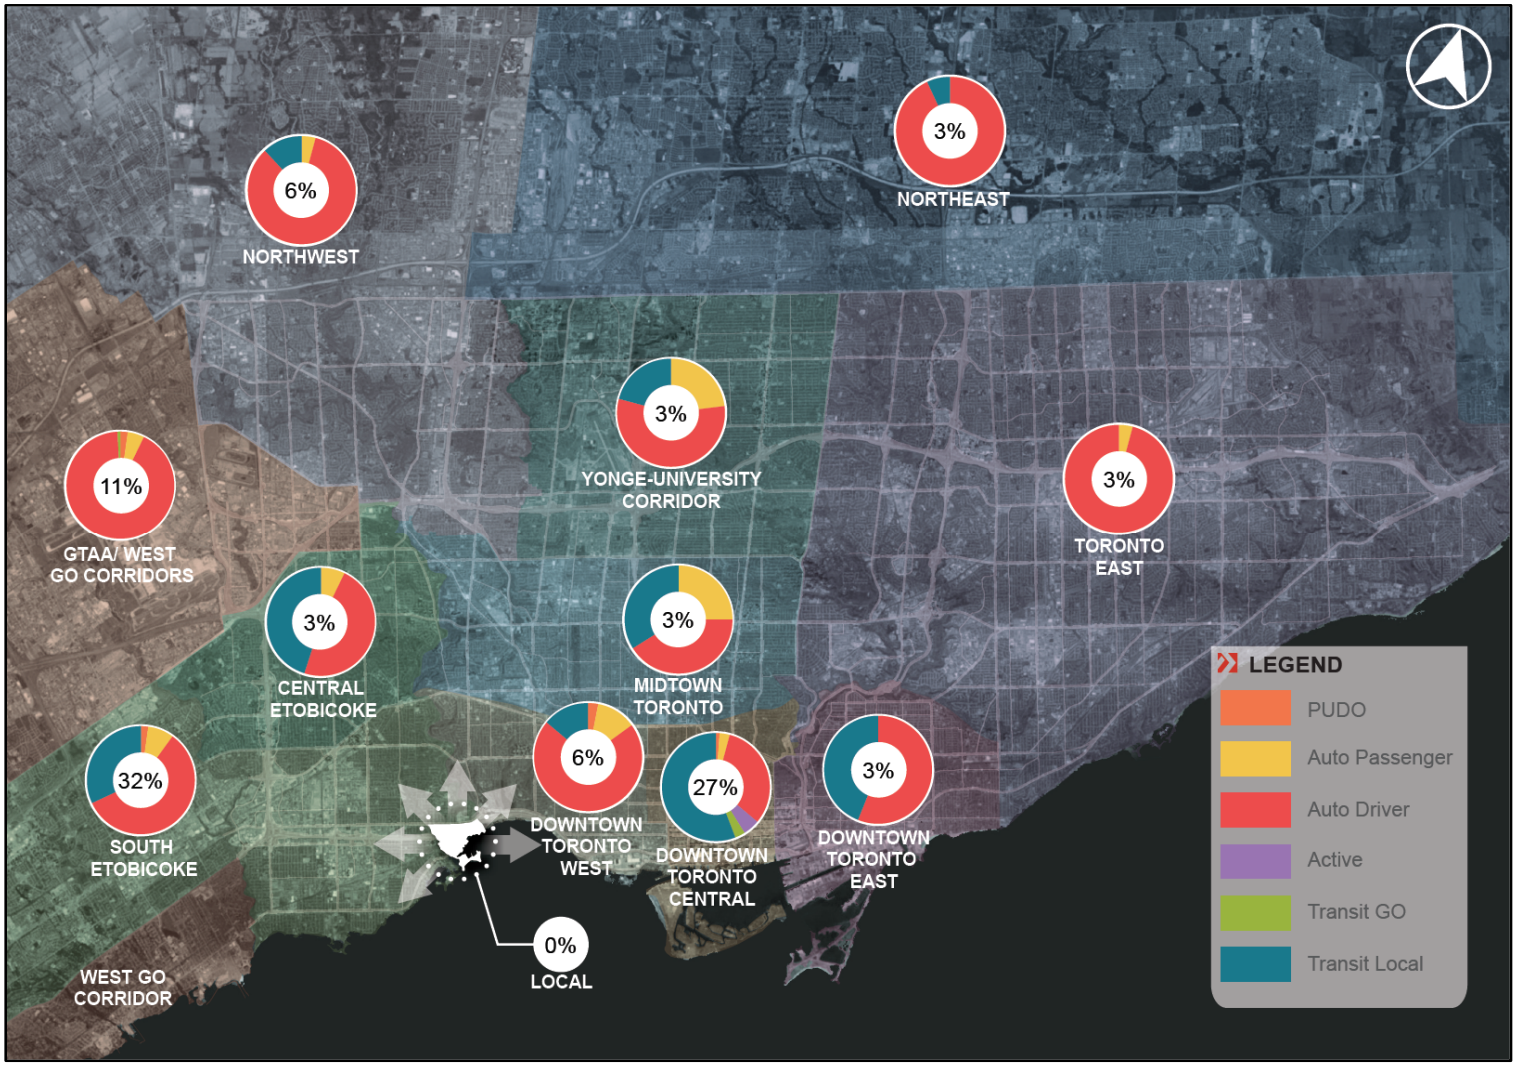

Figure 1-5: Existing Peripheral Residential Distribution by Mode

1.4.1.2 Future Characteristics

Distribution

Residential travel characteristics, which largely represent the travel characteristics of the area today, are anticipated to be influenced by both distribution and mode share considerations.

The existing patterns, as summarized above, will change with new transit access and strengthened connections. There will also be draws to developing areas of the city.

The Downtown Toronto distribution zones for purposes of this study is considered in three areas: west, central, and east. The Downtown Toronto Central distribution zone including the central business district and generally the area between Spadina and Jarvis and south of Dupont will continue to be the largest draw for homebased trips. However with increasing development (employment, service, cultural) in the west and east areas of downtown Toronto (Liberty Village and future Unilever site) and, in particular SmartTrack and GO RER major investments (new stations in the west and east areas of downtown Toronto), there will be more attraction to the Downtown Toronto West and East distribution zones. Increased employment in particular is expected to attract additional trips to these areas.

With the strengthening of the connections to downtown areas, it is anticipated that the excellent access will attract residents who work in downtown.

In addition to the above, given the proposed mixed use nature of the proposed developments in the Site area, a large component of Local Residential trips are expected to be to and from other land uses within the Local distribution zone.

In estimating the future distribution of proposed residential, the existing distribution was adopted as a base, with increases primarily made to the distributions to the Downtown Toronto and Local distribution zones and commensurate decreases primarily made to the distributions to South / Central Etobicoke and Other Areas distribution zones.

The adopted future distribution of residential trips was estimated based on the foregoing considerations, as well as projected travel time benefits associated with the new station as discussed in Table 1-1. Comparisons were made with proxy areas with similar access considerations (particularly to the Downtown Toronto distribution zones). The proxy data for the following areas is summarized in Table 1-4:

- Liberty Village
- Bloor-Dundas
- Yonge-Eglinton
- Yonge-St Clair

The existing and projected future residential trip distribution is summarized in Table 1-5.

Table 1-4 Residential Trip Distribution Proxy Data

Other	16%	5%	12%	10%
Total	**100%**	**100%**	**100%**	**100%**

Mode Share

Further to the above, mode shares to and from these distribution zones are expected to change with the new transit access and strengthened connections.

In estimating the future mode shares to and from each of the distribution zones for residential, the existing mode shares were adopted as a base, with changes made as considered appropriate.

The adopted future mode shares were estimated based on the foregoing new infrastructure considerations and projected travel time benefits associated with the new station as discussed in Table 1-1. Consideration was also given to the future convenience of active transportation access.

Similar to the distribution, a comparison with proxy areas with similar access considerations was also utilized in determining appropriate mode shares. The proxy areas used in estimating mode shares varied by distribution zone and mode.

For example, comparisons for auto and transit mode shares to and from the Downtown Toronto distribution zones and other zones with convenient transit access were generally based primarily on proxy areas with similarly convenient transit access (GO and subway), such as:

- Yonge-Eglinton;
- Yonge-St Clair;
- Bloor-Dundas; and
- Liberty Village.

Substantial alterations were not made to auto and transit mode shares to and from the South / Central Etobicoke distribution zones and other zones further afield with less convenient transit access, albeit an allowance for Transit GO mode share was made for GO Transit accessible distribution zones.

In assessing the GO mode share in these instances, comparisons were primarily made against Liberty Village, noting it's proximity to the Site area and location on the same GO line.

Comparisons for active mode shares were primarily made to proxy areas which were located in closer proximity to the Site area, such as:

- Mimico;
- Liberty Village;
- Bloor-Dundas; and
- Kipling.

With respect to trips between the Local Residential and the Local distribution zone, it was assumed that all trips were walking trips.

The proxy data is summarized in Table 1-6. The overall resultant existing and adopted future residential mode share is summarized in Table 1-7. The detailed future mode share by location is provided in the following summary section.

Summary

The projected distribution by distribution zone for proposed background development residential travel is summarized in Table 1-8 and Table 1-9 for Local Residential and Peripheral Residential respectively and shown graphically in Figure 1-6 and Figure 1-7 respectively.

It is noted that the overall auto mode split for the Local Residential is generally consistent with proxy areas such as:

- Yonge-Eglinton (28% auto driver mode split);
- Yonge-St Clair (30% auto driver mode split); and
- Liberty Village (31% auto driver mode split).

Given the future context of the area, this is considered to be appropriate. Given the Peripheral Residential is located further away from the proposed GO Station and the mixed use nature of the Local distribution zone, a slightly higher auto mode split is projected.

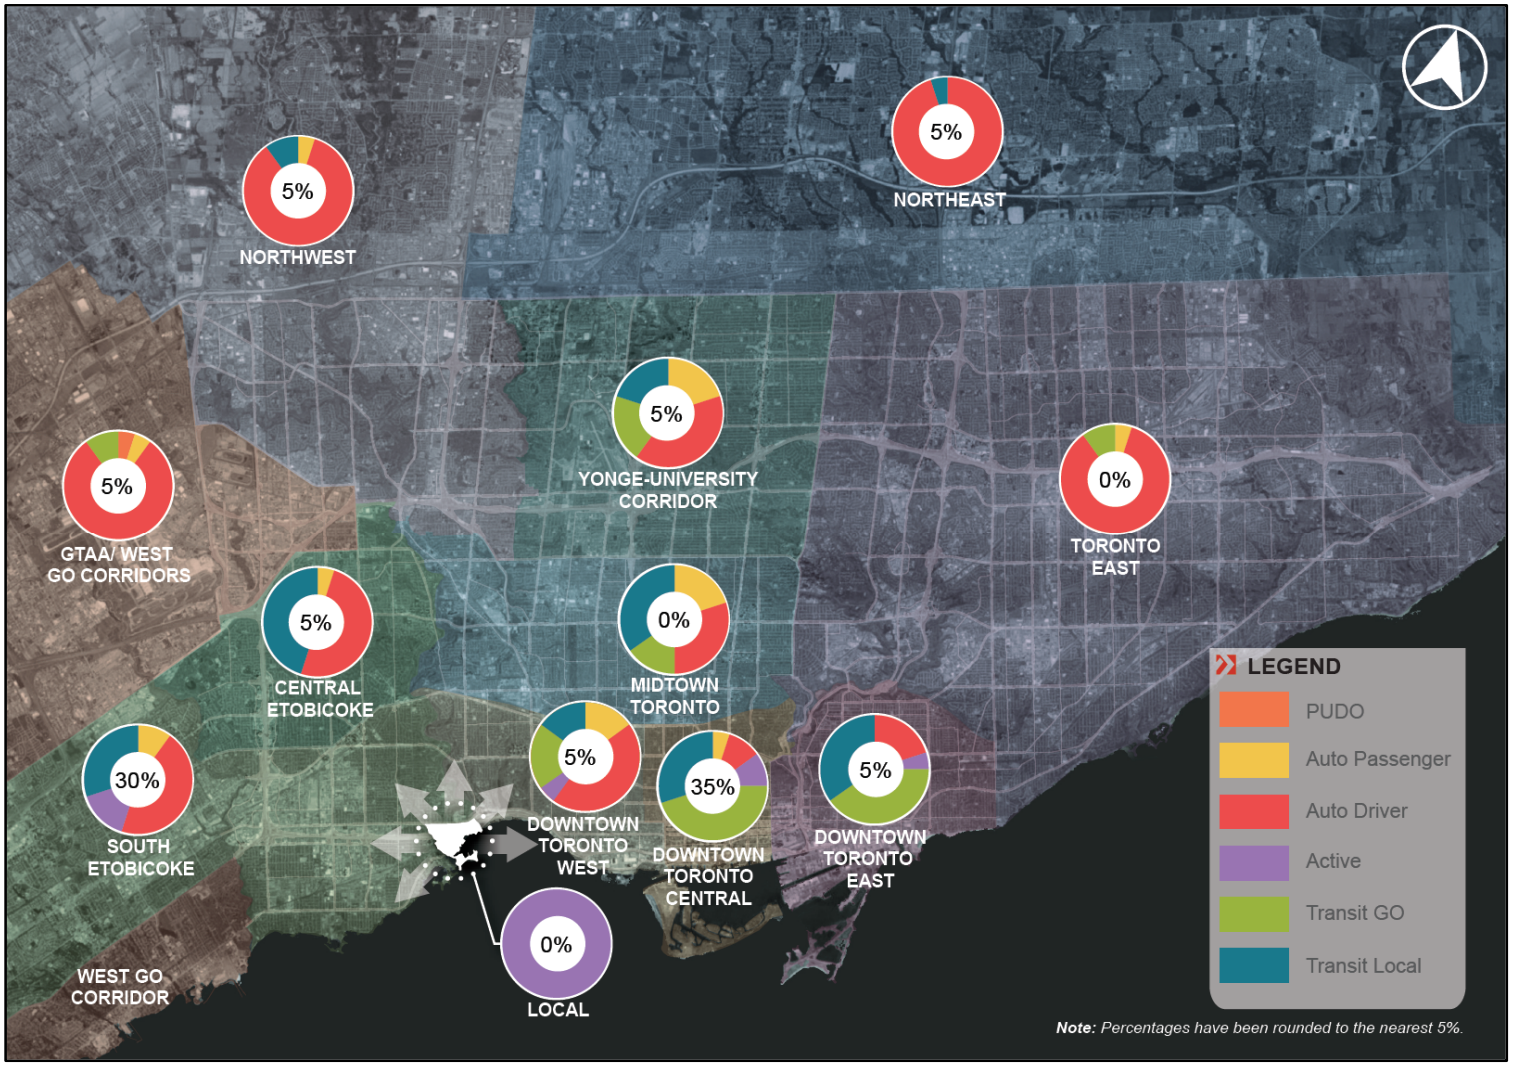

Figure 1-7: Projected Peripheral Residential Distribution by Mode

1.4.2 Office Travel

Given the limited office uses currently within the immediate area, there is limited existing travel characteristics to draw upon. As such, in estimating the future distribution and mode shares of proposed background development office, proxy areas were reviewed and distributions and mode shares were adopted based on a combined consideration of the relevant proxy areas in each instance, as well as the future context of the Site area with regards to proposed infrastructure and mixed use nature.

Distribution

The methodology with respect to which proxy areas were used in each instance remained generally consistent with that used in determining the residential characteristics, as outlined in Section 1.4.1 above. It is noted however that due to the dispersion of office across Toronto, in some instances, the same proxy areas as used for residential were not always available for office.

The adopted future distribution for Downtown Toronto distribution zones was based primarily on proxy data for:

- Bloor-Dundas
- Liberty Village
- Yonge-Eglinton
- Yonge-St Clair

The proxy data is summarized in Table 1-10. Beyond the Downtown Toronto distribution zones, the adopted future distribution was estimated based primarily on proxy data for Liberty Village and Bloor-Dundas. The projected future trip distribution is summarized in Table 1-11.

It is noted that as it is located outside of the Site area, the adopted distribution for Peripheral Office does not include any trips to the Local distribution zone. The adopted distribution for Peripheral Office to the remaining distribution zones remains consistent with the adopted distribution for Local Office, with proportionate adjustments made accordingly.

Local	10%	0%
Other	20%	22%
Total	**100%**	**100%**

Mode Share

Similar to residential, auto and transit mode shares to and from Downtown Toronto distribution zones and other distribution zones with convenient transit access were generally based on proxy areas such as:

- Yonge-Eglinton
- Yonge-St Clair
- Liberty Village.

Auto and transit mode shares to and from South / Central Etobicoke distribution zones and other distribution zones further afield with less convenient transit access, as well as active mode shares to all distribution zones, were primarily based on proxy areas such as:

- Liberty Village
- Bloor-Dundas

As per the residential, it was assumed that trips between the Local Office and the Local distribution zone, were walking trips.

The proxy data is summarized in Table 1-12 and the resultant adopted future mode share is summarized in Table 1-13. The detailed future mode share by location is provided in the following summary section.

Summary

The projected distribution by distribution zone for proposed background development office travel is summarized in Table 1-14 and Table 1-15 for Local Office and Peripheral Office respectively and shown graphically in Figure 1-8 and Figure 1-9 respectively.

It is noted that the overall auto mode split is generally consistent with proxy areas such as:

- Yonge-Eglinton (33% auto driver mode split); and
- Yonge-St Clair (24% auto driver mode split).

Given the future context of the Site, this is considered to be appropriate.

1.4.3 Retail Travel

Distribution

Given the limited retail uses currently within the area, there is limited existing travel characteristics to draw upon.

Generally, the proposed background development retail is expected to be largely local in nature. Given its ancillary nature, it is assumed that the retail associated with the Humber Bay Shores development will be entirely local serving. Whilst the retail associated with the 2150 Lake Shore Boulevard West development is also expected to first and foremost service residents and staff of nearby development, the nature of the retail as a consolidated unit is such that it is likely to attract some trips external to the Local distribution zone. During weekday mornings, retail trips to/from the 2150 Lake Shore Boulevard West development are expected to be primarily local in nature (i.e. to/from the Local distribution zone). This is expected to a slightly lesser extent during weekday evenings, where entertainment based uses and larger scale stores may generate more trips to/from areas external to the Local distribution zone (External trips).

The key assumptions for the 2150 Lake Shore Boulevard West site are the following (as summarized in Table 1-16):

- 90% of retail-based trips during the AM peak hour will be to/from the Local distribution zone; and
- 75% of retail-based trips during the PM peak hour will be to/from the Local distribution zone.

The remaining trips are assumed to be to and from areas external to the Local distribution zone.

Table 1-16 Adopted Retail Trip Distributions

Distribution Zone	Weekday AM Peak Hour	Weekday PM Peak Hour
Local	90%	75%
External to Local	10%	25%
Total	**100%**	**100%**

Mode Share

As per the residential and office, it was assumed that trips between the retail and the Local distribution zone, were walking trips.

In relation to External trips, 2016 TTS data was sourced in relation to mode splits for retail-based trips which were more than 1,000 metres in length for all of the City of Toronto (TTS 2006 zones 1-625). The data is summarized in Table 1-17.

On the basis of this data, the adopted future retail mode split for External trips is summarized in Table 1-18. The adopted mode split is generally consistent with the data in Table 1-17, with the exception of a slight increase to active trips to account for the substantial density located west of Park Lawn Road which is still in close proximity to the Site area, but outside of the Local distribution zone.

Table 1-17 Retail Mode Split for Trip Length of More than 1,000 Metres

Mode	Mode Split
Transit	16%
Active	4%
Auto	62%
Passenger	17%
PuDo	1%
Total	**100%**

Table 1-18 Adopted Future Retail Mode Split for External Trips

Mode	Projected
Transit Local	15%
Transit GO	5%
Active	10%
Auto	55%
Passenger	15%
PuDo	0%
Total	**100%**

Summary

The overall mode split for the retail is derived by combining the adopted distributions and mode splits for trips to/from the Local distribution zone and External trips, as summarized in Table 1-19 and shown graphically in Figure 1-10. It is noted that the overall mode split varies between the peak hours due to the differing distributions.

Table 1-19 Adopted Overall Site Retail Mode Split

Mode	Weekday AM Peak Hour	Weekday PM Peak Hour
Transit Local	1%	4%
Transit GO	1%	1%
Active	91%	77%
Auto	6%	14%
Passenger	1%	4%
PuDo	0%	0%
Total	**100%**	**100%**

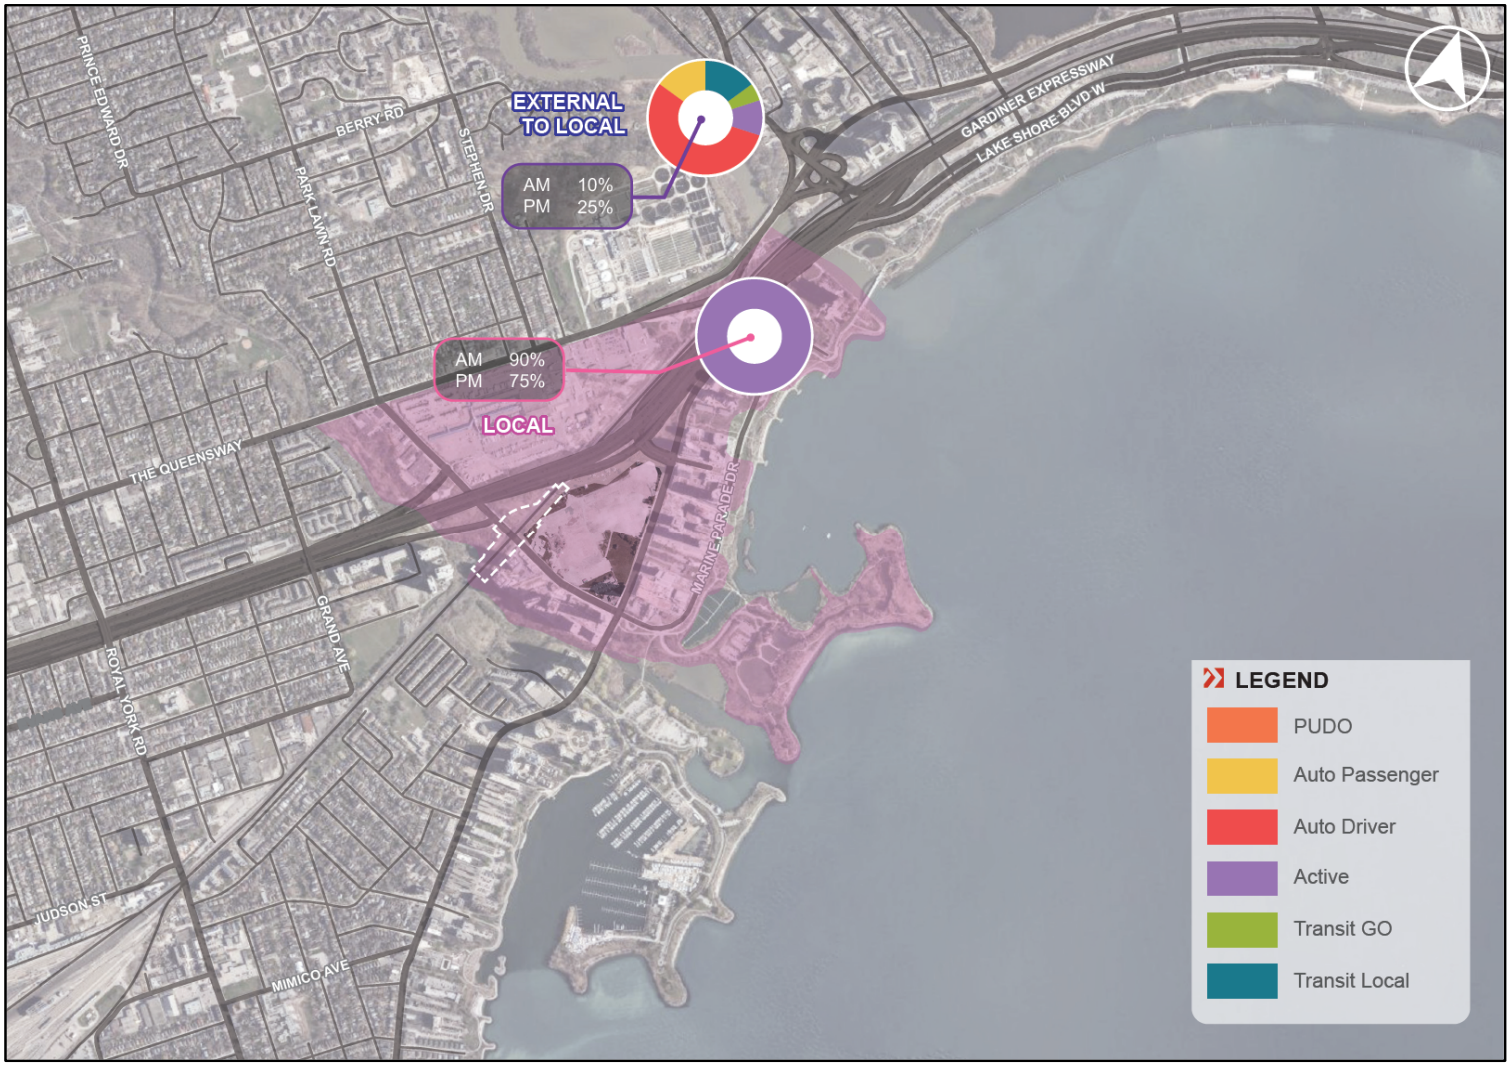

Figure 1-10: Adopted Retail Distribution by Mode

2. Multi-Modal Travel Demand Forecasting

2.1 Forecasting Methodology

Travel demand forecasts have been developed for each of the proposed background developments based on the following:

- **Gross Person Trip Forecasting** – Application of an adopted person trip rate derived based on a comparison of rates established from person count data from various proxy sites, first principles methodologies, and based upon ITE Trip Generation Manual 10th Edition formulations for gross person trips;
- **Pass-by Considerations** – Account for pass-by rates from the ITE Trip Generation Manual 9th Edition for retail uses; and
- **Application of Distribution and Mode Share Assumptions** – Application of future distribution and mode split to the resultant net person trips for each land use to determine site travel demand by mode.

2.1.1 Gross Person Trip Generation

2.1.1.1 Residential Gross Person Trips

Residential person trip rates were established based on a comparison between person counts at proxy developments, by first principles using 2016 TTS data, and ITE Trip Generation Manual 10th Edition formulations. The proxy data includes a range of urban and semi-urban contexts.

The residential person trip generation rates considered as part of the review are summarized in Table 2-1. The adopted residential trip generation rate equates to 0.50 and 0.45 two-way person trips per unit during the AM and PM peak hours, respectively. The resultant projected gross person trips for the background development proposed residential is summarized in Table 2-2.

Table 2-1 Gross Residential Person Trip Rates

Methodology	Person Trip Generation Rate (trips per unit)					
	AM Peak			PM Peak		
	Inbound	Outbound	Two Way	Inbound	Outbound	Two Way

Mimico-Judson *(1,686 units)*	**170**	**675**	**845**	**505**	**255**	**760**
251 Manitoba *(498 units)*	**50**	**200**	**250**	**150**	**75**	**225**

Notes:
1. Estimated number of units remaining to be constructed.

2.1.1.2 *Office Gross Person Trips*

Office person trip rates were established based on a comparison between person counts at proxy developments, and ITE Trip Generation Manual 10th Edition formulations. The proxy data includes a range of urban and semi-urban contexts.

The office person trip generation rates considered as part of the review are summarized in Table 2-3. The adopted office trip generation rate equates to 1.45 and 1.40 two-way person trips per 100 square metres of office GFA during the AM and PM peak hours, respectively. The resultant projected gross person trips for the background development proposed office is summarized in Table 2-4.

Table 2-3 Gross Office Person Trip Rates

2.1.1.3 *Retail Gross Person Trips*

General retail person trip rates were established based on a comparison between person counts at proxy developments (street related and larger format general retail) and ITE Trip Generation Manual 10th Edition formulations.

As previously discussed, it is assumed that the Humber Bay Shores retail will be entirely local serving. The 2150 Lake Shore Boulevard West site retail is also expected to be largely ancillary in nature, however is likely to attract some external trips.

To determine an appropriate rate, a range of retail typologies were reviewed, as outlined in Table 2-5. The adopted retail rates equate to 5.00 and 12.00 two-way person trips per 100 square metres of GFA during the AM and PM peak hours, respectively. The resultant projected gross person trips for the background development proposed retail is summarized in Table 2-6.

Table 2-5 Gross Retail Person Trip Rates

Methodology	Person Trip Generation Rate (trips per 100 m^2)					
	AM Peak			PM Peak

2.1.2 *Travel Demand by Mode*

2.1.2.1 *Residential Demand*

The adopted person trip distributions and associated mode splits for residential trips as outlined in Section 1.4.1.2 of this report were applied to the background residential uses.

The resultant residential trips by mode are summarized in Table 2-8 through to Table 2-13 for each relevant background development respectively.

The overall mode split associated with residential based trips is illustrated in Figure 2-1 and Figure 2-2 for Local Residential (2150 Lake Shore Boulevard West, 42 Park Lawn Road, Humber Bay Shores) and Peripheral Residential (2313 Lake Shore Boulevard West, Mimico-Judson, 251 Manitoba Street) respectively.

2.1.2.2 *Office Demand*

The adopted person trip distributions and associated mode splits for office trips as outlined in Section 1.4.2 of this report were applied to the background office uses.

The resultant office trips by mode are summarized in Table 2-14 and Table 2-15 for each relevant background development respectively.

The overall mode split associated with office trips is illustrated in Figure 2-3 and Figure 2-4 for Local Office (2150 Lake Shore Boulevard West) and Peripheral Office (Mimico-Judson) respectively.

2.1.2.3 *Retail Demand*

The adopted person trip distributions and associated mode splits for retail trips as outlined in Section 1.4.3 of this report were applied to the background retail uses.

In addition to the above, pass-by considerations are also applied to the proposed background development retail. The adopted pass-by rate is based upon formulations provided within the ITE Trip Generation Manual.

A pass-by rate of 0% and 34% was adopted for the AM and PM peak hours respectively and was applied to the total External trips after deducting trips to/from the Local distribution zone.

A summary of the forecast retail trips is provided in Table 2-16 and the resultant retail trips by mode are summarized in Table 2-17. The external trips mode split is illustrated in **Error! Reference source not found.** and the overall retail mode splits are shown in Figure 2-5.

Table 2-16 Summary of 2150 Lake Shore Boulevard West Retail Trips
